PREFACE

POLITICAL Economy, though not deemed an essential branch of education for churchmen, touches very closely, notwithstanding, on certain questions, in which both the interest and the duty of ecclesiastics are deeply concerned. The questions of Pauperism and of a Religious Establishment, though no others could be specified, would, of themselves, justify a reference to the lessons and principles of this science, even in a theological course.

But there is one general application that might be made of the whole subject, and which gives it, in our judgment, its principal claim on the earnest and respectful attention of a Christian philanthropist. Political economy aims at the diffusion of sufficiency and comfort throughout the mass of the population, by a multiplication or enlargement of the outward means and materials of human enjoyment. Now, we hold it to be demonstrable, on its own principles, that, vary its devices and expedients as it may, this is an object which it never can secure, apart from a virtuous and educated peasantry. Our endeavour is to prove, that, in every direction, there is a limit to the augmentation of

our physical resources, and that, in virtue of this, there must, especially in old countries, be a felt pressure and discomfort throughout every community, which has either outgrown the means for its Christian instruction, or, in any other way, renounced the habits and decencies of a Christian land. In other words, our object will be gained, if we can demonstrate, that, even but for the economic well-being of a people, their moral and religious education is the first and greatest object of national policy, and that, while this is neglected, a government, in its anxious and incessant labours for a well conditioned state of the commonwealth, will only flounder from one delusive shift or expedient to another, under the double misfortune, of being held responsible for the prosperity of the land, and yet, finding this to be an element most helplessly and hopelessly beyond its control.

It is obvious of such a task as that which we have prescribed to ourselves, that it cannot fully be accomplished, without an extensive range and survey among the doctrines of political economy. More especially, the theory of wealth had to be examined in connexion with the theory of population, and the great resulting lesson is—the intimate alliance which obtains between the economical and the moral, insomuch, that the best objects of the science cannot, by any possibility, be realized, but by dint of prudence and virtue among the common people.

Some of the text in this volume was recently

delivered in Lectures to the Students of the Theological Hall in Edinburgh We gladly transfer them from the chair to the press, were it for no other reason, than to relieve our academic work, in all time coming, even from the semblance of aught that is extra-professional * We cannot, however, bid adieu to political economy, without an earnest recommendation of its lessons to all those who enter upon the ecclesiastical vocation They are our churchmen, in fact, who could best carry the most important of these lessons into practical effect If sufficiently enlightened on the question of pauperism, they might, with the greatest ease, in Scotland, clear away this moral leprosy from their respective parishes And, standing at the head of Christian education, they are the alone effectual dispensers of all those civil and economical blessings which would follow in its train

We are not sanguine either of a general or of an instant reception for the doctrines of our work Its novelties may long be disregarded or decided as paradoxes And it is not the achievement of a day, to overturn the principles of a reigning school

* It may be right to mention, that all which we did deliver upon this subject, was in a separate lectureship of one hour in the week, distinct from the regular lessons of the Theological course, though preparatory to our views on the treatment of pauperism, and other questions in parish economics, which enter largely into the duties and attentions of the pastoral care It besides formed the natural precursor to another lectureship which we have begun, on the methods and the machinery of Christian education

And if not very hopeful of an instant acquiescence in our principles, far less do we look for the instant adoption of our practical suggestions. The urgencies of the country may perhaps speed onwards the commutation of tithes, and the measure of a universal education. The commutation of taxes into a territorial impost, will be the work of a later age, though we should rejoice even now, did we witness a commencement however humble, an approximation however slow, to this great political and economical reform.

May God of His infinite mercy grant, that whatever the coming changes in the state and history of this nation may be, they shall not be the result of a sweeping and headlong anarchy, but rather, in the pacific march of improvement, may they anticipate this tremendous evil, and avert it from our borders. There is a general impression upon all spirits, that something must be done. But to be done well, it must not be by the hand of violence, but by the authority of legitimate power under the guidance of principle, by a government having both the wisdom and righteousness to direct, and the strength to execute. Amid the conflicts and agitations of our social state, it will be the heart's desire of every Christian, the fondest prayer of every true patriot, that Religion and Reason may ever preside over the destinies of our beloved land.

ON
POLITICAL ECONOMY,
IN CONNECTION WITH THE
MORAL STATE AND MORAL PROSPECTS
OF
SOCIETY

CHAPTER

ON THE INCREASE AND LIMIT OF FOOD

1 EACH science has certain commanding positions, whence, if the observer look rightly around him, he may obtain an extensive view of important truths and important applications. Such a position, we think, has been recently gained in Political Economy, although full advantage has not yet been taken of it. We hold it the more interesting, that it includes within its range, certain unexplored places of the science, and, more especially, that department where the theory of wealth comes into contact with the theory of population, and where the two, therefore, might be examined in connexion

2 The doctrine, or discovery, to which we refer, is that promulgated some years ago, and both at the same time, by Sir Edward West and Mr Malthus. It respects the land last entered upon for the purposes of cultivation, and which yields no rent. It is obvious, that land of this inferior productiveness must mark the extreme limit of cultivation at the time—as land of still inferior quality could not be broken up without loss to the cultivator.

3 Any land that is cultivated for food to human beings, must, at least, yield ~~as~~ much as shall feed the labourers who are employed in working it. But it must do more than this. These agricultural labourers require to be clothed and lodged, as well as fed. They must be upheld, not in food alone, which is the first necessary, but in, what may be termed, the second necessities of life. The people whose business it is to work up these, may, in contradistinction to the *agricultural*, be termed the *secondary* labourers of a country. It is evident, that the worst of cultivated land must, at least, be able to feed those who are directly employed upon the soil, and, moreover, those who prepare for the agricultural labourers all the other articles, beside food, which enter into their support or maintenance. Else the cultivation of it behoved to be abandoned. All that land which, by no possible improvement, either in the processes of husbandry or of manufacturing labour, could yield as much as would subsist the agricultural labourers

and then secondaries, is doomed, by nature, to everlasting sterility, and must always remain without the scope of cultivation

4 The imagination is, that the land of greatest fertility was first occupied. Men would naturally settle on those soils which yielded the most plentiful return for their labour, or which enabled them to subsist with the least labour. It is farther conceived, that, after all the first-rate land had been cultivated, an increasing population flowed over, as it were, on the second-rate land, which, in virtue of its inferior quality, yielded a scantier return for the same labour. As mankind continued to multiply, a still farther descent behoved to be made, through a gradation of soils, each of less fertility than the one before entered on, and so, either requiring a greater amount of labour to draw from it the same food, or yielding a smaller amount of food to the same labour. This process, it is evident, admits of being extended, till the produce of the soil last entered on shall, by the utmost labour which men will expend on it, be barely sufficient for the subsistence of its agricultural labourers, and of their secondaries.

5 In filling up this sketch, or *histoire raisonnée*, of the conjunct process of culture and population, economists have given in to certain conceptions, which require to be modified. They sometimes describe the process, as if, at each successive descent to an inferior soil, the comfort and circumstances of the human race underwent deterioration,

or as if, under the impulse of a hard and hunger-bitten necessity, men were driven, like so many famishing wolves, to those intractable soils, whence they could only force out a more stinted and penurious fare than before—and that, at a greater expense of toil and of endurance. Agreeably to this imagination, even economists and calculators have, by a reverse process, found their way to a golden age at the outset of the world—when men reposed in the lap of abundance, and, with no other fatigue than that of a slight and superficial operation on a soil of first-rate quality, richly partook in the bounties of nature. But when all this soil came to be occupied, and the race continued to multiply, land of a second quality behoved to be taken in—and the conception is, that, at every such transition from a better to a worse land, a heavier imposition of toil was laid upon workmen, and a smaller amount of produce was yielded to them in return for their industry. This, certainly, represents to us the species in a course of deterioration, at least, in as far as the comfort of the labouring classes is concerned. They are pictured to the eye, as if goaded on by hard and stubborn necessity at every step of this movement, and going forth in starving multitudes, from that better land, which is now too narrow for them. At each new stretch of cultivation, a more ungrateful soil has to be encountered, on which it is thought that men are more strenuously wrought, and more scantily subsisted, than before—till, at the extreme

limit of this progression, a life of utmost toil, and utmost penury, is looked to as the inevitable doom that awaits the working classes of society

6 Now, generally speaking, this is not accordant with historical truth. We do read of extensive emigrations, by men who felt themselves straitened in their native land, and went forth in quest of a settlement. But we do not witness, throughout the various countries of the world, the successive degradation of their peasantry. There may be fluctuations in their economic state, from year to year, or from generation to generation. But on the survey and comparison of centuries, we should rather say, that there had been a general march and elevation in the style of their enjoyments. There is a seeming incompatibility in this fact with the process which has just been described—and this has cast a suspicion over its reality. Men have been at a loss to reconcile the descent of labourers among the inferior soils, with the undoubted rise which has taken place in their circumstances, or in the average standard of their comfort. This has darkened the whole speculation, and brought on a controversy, which admits, however, we think, of a very obvious and easy adjustment.

7 For as the fresh soils that had to be successively entered on became more intractable, the same amount of labour, by the intervention of tools and instruments of husbandry, may have become greatly more effective. The same labour which, by a direct manual operation, could raise a given

quantity of subsistence from soil of the first quality, might, with our present implements of agriculture, raise as much from soil of the last quality that has been entered on. If, from one generation to another, a descent had to be made on more stubborn and impracticable soils, and which, therefore, required a far more expensive treatment, ere they could be brought to yield as abundantly, as did their predecessor soils, in the career of agriculture—it should be remembered that, by this time, the labour of human hands might have been helped and facilitated, to the whole extent of the difference, by the implements of labour. With the scraping and stirring of first-rate land by the branch of a tree, there might be as much of real muscular work required to obtain from it the same quantity of produce, as from second-rate land by means of a wooden spade, or from third-rate land by means of an iron one, or from fourth-rate land by means of a plough, or lastly, from fifth-rate and following lands, by means of those successive improvements in the form of the plough, whereby it is made more effective than before. We will not yet designate the implements of husbandry by the name of capital, but, considering them merely as the products of labour, it is enough at present to affirm, that the whole labour, first, of making the plough, and then of working it on the soil of the last and latest quality, might fetch back as liberal a return of food to the cultivators, as an equal quantity of labour bestowed either directly by the hand, or with the

intervention of some rude and clumsy instrument on the land that was earliest entered on. It is thus that there may at once be a progress in agriculture, and yet, through all the gradations of it, the species be upheld in as great ease and sufficiency as at first. Instead of the strong impulse of population driving them helplessly and ungovernably onward, to those more inhospitable regions, where they are doomed to all the miseries of a more stunted provision than before,—they may, simply and spontaneously, and without the pressure of any felt agony or violence, have entered on the possession of these regions, because now furnished by art with the means of extracting, even from the comparative barrenness of nature, as generous a remuneration for their toils, as they before drew from nature's greatest fertility. We are not, therefore, to imagine of the great family of mankind, that as they grew in numbers, and spread themselves over upon tracks of greater sterility than before, they must necessarily sink down into a state of greater endurance, whether in the way of privation or fatigue. It is not always at the call of hunger or distress that these successive movements have been made. They are often made in another character—not in that of famishing hordes, making forcible descent on some untired region, in quest of that which might satiate their cravings, but in the higher character of dominant and devising men, walking forth with master step, and in the triumph of their new energies and acquisitions, to subdue

some yet untrodden territory, and force from it as liberal subsistence, as any which their ancestors had ever gotten in more favoured climes. We are not to suppose that every increase of cultivation is marked by an increase of wretchedness. Through its whole process, from the first to the last of it, the species might be sustained on as high a level, and even be made to ascend higher than at the first. And, as at the commencement of cultivation, there might have been impediments to be struggled with at the entrance upon the first land, such as the clearing it of wood,—so, on the extreme verge of our newest cultivation, there might have been helps to labour on the fast and worst land, such as the perfection of our modern implements, which could ensure as generous a repayment for the same quantity of work, in the most recent, as in the most remote stages of this great process.

8 It follows not, that in the act of descending to an inferior soil, men have to put forth a greater quantity of labour for the same return,—because, it may have been some improvement in the modes or operations of husbandry, which has enabled them to make the descent, and to make the same labour as effective on the ground which they are now reclaiming from the waste, as on that which they had last brought within the domain of cultivation. When, therefore, we see the wilds of nature further broken in upon, we are not always to imagine, that it is from the pressure of a felt necessity, by which men have been forced to submit

to a more painful endurance, and to put up with a scantier subsistence in return for it. It may have been the pacific, the prosperous result of some enlargement in the powers of agricultural labour, and in consequence of which, men go spontaneously forth on an inferior soil, because now, for the same work, they earn the same recompense as they did on the soil immediately above it. It is thus a possible thing, that cultivation may be extended, without deterioration to the comfort of labourers, and that, along its last possible frontier, there might be stationed as high and well-conditioned a peasantry, as ever flourished in any olden or golden period on the lawns of Arcadia.

9 And cultivation may be extended by an improvement in manufacturing, as well as in agricultural labour. It may be conceived of the land last entered, that in return for a certain quantity of labour, it yields the subsistence of a hundred families, and that the land next inferior to it cannot be profitably cultivated, because in return for the same labour, it yields the subsistence of only ninety families. Now, overlooking for the present the element of profit, one might conceive these hundred families to be made up of seventy belonging to the agricultural, and of thirty belonging to the secondary class,—it being the employment of the latter to prepare, for the whole hundred, the second necessities of life. It matters not whether there be such an improvement in agricultural labour, that sixty can do the work of seventy, or

such an improvement in manufacturing labour, that twenty can do the work of thirty. In either way, ninety labourers can do as much as a hundred did before, and whereas, formerly, land beloved to return for their labour the subsistence of a hundred families, ere it could be taken in, it may now be taken in, though of such inferior quality, as to return the subsistence of but ninety families. By the former improvement, the agricultural labourers necessary for a given effect, became fewer than before,—by the latter improvement, though still as numerous, they would require the services of fewer secondaries than before. It is thus that a step of improvement in manufactures alone, can give rise to an onward step of extension in agriculture—and just because a method has been devised for the fabrication of as many yards of cloth, by fewer hands, soils of poorer out field, than any that had yet been reached, may now be profitably entered upon. An improvement in the form of the stocking machine, may, as well as an improvement in the form of the plough, bring many an else unclaimed acre within the reach of cultivation.

10 The actual and historical process that has taken place, we believe to be as follows. The labourers of our day work harder than before, but live better than before. They put forth more strength, and receive more sustenance, than they wont to do. There has been an increase on both of these terms, or, such has been the change of habit among workmen, that while greatly more

industrious, they, at the same time, have become greatly more luxurious. They at once toil more strenuously, and live more plentifully—putting forth more strength, but withal, drawing the remuneration of a larger and more liberal sustenance. This we apprehend to be the actual change of habit and condition which has taken place, with artisans and labourers, in all the countries of civilized Europe,—so that while, on the one hand, we behold a harder working peasantry, we, on the other hand, behold them more richly upholden, both in the first and second necessities of life.

11 Now, this may be either a deterioration or an improvement in their circumstances. One can imagine a day of slavish fatigue, followed by an evening of gross and loathsome sensuality,—as is often exemplified in the life of a London coal-heaver, whose enormous wage is absorbed in the enormous consumption, by which he repairs the waste and the weariness of an excessive labour. This, surely, is not a desirable habitude for the commonalty of any land, nor do we read the characteristics of a high or a well-conditioned peasantry in a state of existence, made up, first of drudgery to the uttermost of their strength, and then of grovelling dissipation to the uttermost of their means. They spend one part of their revolving day in the exercise of powers, which are merely animal, and the other part in the indulgence of enjoyments, which also are merely animal—like beasts of burden, who are better wrought than be-

fore, and, in return for this, are better fed, and lodged, and littered than before. They are now in better keep than their forefathers, and this puts them into heart for the greater work that is extracted out of them. Still it is conceivable of the work, that it may be so very extreme, as, on the whole, to degrade and to depress these overdone children of modern industry—and that, in spite of the greater abundance wherewith their senses and their spirits are coarsely regaled, during the intervals of their sore bondage.

12 If this be the extreme to which the workmen of our present day are now tending, there is an extreme opposite to this, from which men only began to emerge at the outset of civilization, and which is still realized among barbarous and demi-barbarous nations. We advert to the sordid condition of those, whom nought but the agonies of hunger can impel to shake off an indolence that is else unconquerable, and who, as soon as they have satisfied its cravings, lapse again into the rooted and habitual lethargy of their nature. If they have but enough of sleep, and enough of surfeiting, they care for no higher gratification, nor will they make one effort, above that level to which they subside, by the weight of their own constitutional sluggishness. Food, of some description or other, they must have—but, having it, they are pleased to live in filth and nakedness, and nearly in utter want of all the secondary accommodations. It is obvious, of such a people, that so long as they abide in this

habit, the inferior soils of the earth never will be reached by them. It is even possible that they may stop short at the very first and most fertile of the land, and never taste of that abundance which is within their reach, just because of their insuperable aversion to the labour of extracting it. It is thus that they might doze away their existence on the surface of an earth, whose dormant capabilities they never enter upon, and in vast territories, capable of sustaining millions over and above the few stragglers by whom they are occupied, both cultivation and population may, just because of this moral barrier, have been fixed and limited for many centuries.

13 So that, on reasoning on the causes which have led to the extension of agriculture among sterile and intractable soils, other things must be taken into account, beside the mere energy of the principle of population. We have already shown, how, without bringing this principle into collision with a taste for the enjoyments of life, there may, without any compromise of these enjoyments, and by a mere improvement in the powers of mechanical labour, be a descent among the inferior soils, and so an extension of agriculture, to afford the increasing population as large and liberal a subsistence as before. And it is evident, the very same thing would happen, with every increase that took place in the amount of manual labour, or in the industrious habits of the people. Certain it is, that, in climes and countries the most favourable to pro-

duction, we may often witness the squalid destitution of whole tribes, restrained, by the mere force of indolence,* from the enjoyment of that plenty, which, with but a little effort, they could so easily realize. Now this proceeds, not from the principle of population being of smaller strength there than in other parts of the world, but from the counter-active force of indolence being there of greater strength. There is a lethargy, or love of ease, in certain temperaments, which will even carry it over the love of offspring, so that, should it not prevent early marriages, it will, at least, prevent a larger proportion of the fruits of marriage from ripening into maturity. Of the many children who are born, a few only will survive the sickness and the spare living to which they are exposed, from that state of voluntary destitution, wherein their parents will rather abide, than put forth those efforts of industry which they feel to be intolerable. Just as the taste for secondary enjoyments has not yet aroused them to exertion, so neither might affection for their famishing and misguided little ones arouse them. This accounts for the population being stationary in many countries, where, as yet, the first-rate soils have scarcely been entered upon—and it should convince us, that something else than the mere energy of this principle must be adverted to, when we reason on that historical progress which has conjunctly taken place, in the extension of husbandry and in the numbers of mankind.

14 But if, by the strength of human indolence,

the process of cultivation may be arrested at an earlier stage in the scale of descending fertility, then, should this indolence, by some cause or other, be removed, or got the better of, the process may be again set at liberty. Now, there is no influence by which man is more effectually roused to exertion, than the excitement of new desires, which require exertion ere they can be appeased. Let him, by any chance, come to have a greater number of wants than before, and, to supply these, he may be led to work a greater number of hours than before. His taste for idleness will give way to his taste for other things, when he comes to like these other things better than his idleness. If he will not be satisfied but with a certain style of dress and lodging, or with the enjoyment of certain luxuries, which his forefathers never dreamed of—then, rather than be without them, he will put forth a strenuous and sustained effort of regular industry, which his forefathers would have felt to be intolerable. This change of habit has actually taken place in modern Europe. Workmen both labour more, and live better, than their ancestors.

15 This is one important service which commerce has rendered to agriculture. It was the instrument of that great economic change which took place at the termination of the middle ages—when landlords dismissed their retainers, and expended the surplus produce of their estates on the purchase of those articles which trade and manufactures brought to their door. This great transi-

tion has been well described both by Adam Smith and Dr. Robertson; but it should not be overlooked, that, beside the re-action on landlords, there was also at that time a strong re-action produced on the habit of labourers. With their growing taste for the new enjoyments which had been placed within their reach, there was, in order to obtain them, a willingness to forego the lounging and lazzaroni life which they formerly indulged in, and to brook the restraints and the toils of regular industry. A mighty extension must have arisen to agriculture, not merely from the new power that has been given to the implements of labour, but from the new habit that has been given to the labourers themselves. If they now work double of what they did formerly, then, all other circumstances being equal, the land last entered on will, in return for the same labour, only have to feed half of the number of agricultural labourers which it did formerly. It affords room for an immense enlargement, when, in virtue of this moral transition alone, the cultivation which stopped short at the land that, for a given amount of work, returned the subsistence of twenty families, may now be carried downward to a more barren and uncomplying soil, that, in return for the same work, yields but the subsistence of ten families. In this way too, then, have trade and manufactures widened the domain of cultivation; and the products of the former have stimulated and called forth in greater abundance the products of the latter.

16. It is thus that, by a more strenuous industry, and a more effective machinery together, the poorer soils may, to a certain extent, be forced to yield an equal, or, perhaps, a more liberal subsistence to the labourer, than at earlier stages in the process of cultivation. Yet it must be quite evident, that, whether in single countries, or in the whole world, it is a process which cannot go on indefinitely. The time may be indefinitely distant, and indeed may never come, when the absolute and impassable barrier shall at length be arrived at. But to be satisfied that there is such a barrier, one has only to look to the extent and quality of the land in any region of the earth. By labour we might grind even the naked rock into an arable soil,—but a soil thus formed never would return the expense of food bestowed upon the labourers. In every country there is an upland or outfield territory, which will always bid defiance to agriculture. And even though it were not so—though to its last acre it possessed a uniform richness—though the plough might be carried over the whole of the mighty continent, and should find an obstacle nowhere but at the margin of the sea; yet, as sure as that every country has its limit, and every continent its shore, we must acquiesce in it as one of the stern necessities of our condition, that the earth we tread upon, can only be made to yield a limited produce, and so to sustain a limited population.

17. It seems very generally admitted, that should it ever come to this, the population, brought to a

stand in respect of numbers, must either have to encounter great positive distress, or must anticipate this distress by a preventive regimen. In the midst of all the minuter criticisms to which the doctrine has been exposed, the great historical fact remains unshaken—that, let the means of subsistence be increased however largely and suddenly, this is sure to be followed by a corresponding increase of population. Every state and country in the world bears evidence to this truth—whether in the steady augmentations of Europe, or in the gigantic strides that are now making in the population of America. The invariable connection, as of antecedent and consequent, between a great extent of fertile and unoccupied land, and a great multiplication of families, when once it is entered upon, is too palpable to be obscured by any sophistry, or by the allegation of any mystic principle whatever. Yet the power to support, and the power to create a population, are just as distinct, the one from the other, as the constitution of the external world is distinct from the constitution or physiology of human nature. It is not an increase of the former power which gives rise to an increase of the latter—it only gives situation and space for the development of its energies. Should a population, when every let and hindrance of a straitened subsistence is removed, be able to double itself in fifteen years—it would still have the inherent ability of doing so, after that every acre on the face of the globe had been advanced to its state of uttermost

cultivation. The power of population would then be kept in perpetual abeyance—with a constant disposition to transgress beyond the limits of the world's food, and as constant a check on the expansion of the capabilities which belong to it.

18. All this is very generally allowed ; but then the imagination of many is, that, not until the world be fully cultivated and fully peopled, shall we have any practical interest in the question. They seem to think of the doctrine of Malthus, that the consideration of it may, with all safety, be postponed, till the agriculture of every country and every clime have been carried to its extreme perfection ; and that, meanwhile, the population may proceed as rapidly and recklessly as it may. When a household is straitened by its excessive numbers, or a parish is oppressed by its redundant families—they would bar every argument about the proximate causes of this inconvenience, by the allegation, that there were still thousands of unreclaimed acres at home, or millions in distant places of the earth, though of as little real or substantial consequence to the suffering parties, as if the land were situated in another planet. They appear to conceive, that ere any body can be felt as an obstacle to our progress, it must have come to a dead stand—not aware that to act as a check or impediment, it has only to move more slowly, though in the same direction, than at the rate in which we are advancing ourselves. They proceed on the idea, that no shock or collision can be felt but by the stroke of an im-

pellent on a body at rest—whereas it is enough if the body be but moving at a tardier pace. In the one case, the strength of the collision would be estimated by the whole velocity—yet, in the other, there might still be a very hard collision, though estimated only by a difference of velocities. It is thus that, for the continued pressure of the world's population on its food, it is far from necessary that the food should have reached that stationary maximum, beyond which it cannot be carried. It is enough, for this purpose, that the limit of the world's abundance, though it does recede, should recede more slowly than *would* the limit of the world's population. A pressure, and that a very severe one, may be felt for many ages together, from a difference in the mere tendencies of their increase. The man, who so runs as to break his head against a wall, might receive a severe contusion, even to the breaking of his head, if, instead of a wall, it had been a slowly-retiring barrier. And therefore we do not antedate matters, by taking up now the consideration of Malthus' preventive and positive checks to population. There is scarcely a period, even in the bygone history of the world, when the former checks have not been called for, and the latter have not been in actual operation. To postpone either the argument or its application till the agriculture of the world shall be perfected, is a most unpractical, as well as a most unintelligent view of the question—for long ere this distant consummation can be realized, and even now, may the obstacle of a slowly-retiring limit begin to be felt.

The tendency of a progressive population to outstrip the progressive culture of the earth, may put mankind into a condition of straitness and difficulty—and that for many generations before the earth shall be wholly cultivated. We are not sure, but it may have done so from the commencement of the race, and throughout all its generations. Certain it is, at all events, that the produce of the soil cannot be made to increase at the rate that population *would* increase. Neither mechanical invention, nor more intense manual labour, is sufficient for this purpose. On the supposition that the numbers of mankind were to increase up to their natural capability of increase; no human skill or human labour, though doing their uttermost, could suffice for raising a produce up to the population—nor will the mass of society ever be upheld in comfort, without the operation of certain other principles, by which to restrain the excess of the population over the produce.

19. The impotency of the one expedient, and efficacy of the other, are nowhere more convincingly exhibited, than along what may be termed, the extreme margin of cultivation. It is there where the land pays no rent; * and, laying aside for the present,

* We are aware of a certain modification and minuter sort of controversy, to which the affirmation of the land absolutely paying no rent has given rise. We shall not stop to offer any adjustment on this matter, as it is in no way essential to the validity of our argument. See Mr Prinsep's note to his translation of Say's Political Economy, Vol. II. p. 168.—and Dr. Hamilton on the Progress of Society

the consideration of profit, it is there where the produce that is reared can do no more than feed the labouring cultivators and their secondaries. But let the population increase to the extent of its own inherent power of increase, and it would force the existing limit of cultivation ; or, in other words, flow over upon a soil inferior to that which had last been entered on, or inferior to that which, at the then rate of enjoyment, could do no more than feed the labouring cultivators and their secondaries. The consequence of such a descent is inevitable. The rate of enjoyment must fall. The agricultural workmen must either submit to be worse fed than before ; or, parting with so many of their secondaries, they must submit to be worse clothed, or lodged, or furnished than before. The likelihood is, that they would so proportion their sacrifices, as to suffer in both these ways—and so there behoved to be a general degradation of comfort in the working classes of society. There is, to be sure, another way in which they might possibly extract from the more ungrateful soil, on which they had just entered, the same plenty as before. They may submit to harder labour, by putting forth a more strenuous husbandry on the inferior land—but this too is degradation. Whether by an increase of drudgery, or an increase of destitution, there may, in either way, be a sore aggravation to the misery of labourers.

20. If it be not possible, then, to sustain in comfort and sufficiency the working classes, by keeping

up the produce to the population, when suffered to proceed according to its own spontaneous energies—there seems only to be another alternative for the achievement of this great problem, that of keeping down the population to the produce. We know of no other right, or comfortable, or efficient way of doing this, than by the establishment of a habit and a principle among the labourers themselves. If they will in general enter recklessly into marriage, it is not possible to save a general descent in their circumstances. By the operation of causes already explained, a population may flow onward, in the way of increase, from one age to another, without any abridgment on the comforts of our peasantry. When these are trenched upon, it is no longer a flow—but we should call it an overflow. And the only way, we apprehend, of preventing this overflow, with all its consequent wretchedness and crime, is by the formation of a higher taste for comfort and decency among the peasantry themselves. Marriage is not necessarily the effect of a headlong impulse; but may be a voluntary act, in the determination of which, prudence and forethought have had an influential share. It is evident, that the more we elevate man into a reflective being, and inspire him with self-respect, and give him a demand for larger and more refined accommodations, and, in one word, raise his standard of enjoyment—the more will the important step of marriage become a matter of deliberation and delay. There is the utmost difference, in this respect,

between the man who is content to live on potatoes, and spend his days in a sordid hovel, and the man who aspires, and, indeed, will not be satisfied without that style of food, and furniture, and dress, which we find generally to obtain among a well-conditioned peasantry.* There is a sense of character, as well as a taste for comfort, connected with this habit; and when these become general in a land, there is, of consequence, a most sure and

* Mr. T. Penonnet Thomson, in his able Tract on the "True Theory of Rent," has stated the effect of this difference with laconic felicity and force. "A labourer in Ireland will live and bring up a family on potatoes, a labourer in England will see the world unpeopled first."—"Englishmen have the physical capability of living on potatoes as much as other men, but fortunately they have not the habit, and though it might be wrong to say they would starve first in their own proper persons, they will utterly refuse to multiply upon such diet, the effect of which on population is ultimately the same."—"The Englishman will not live and bring up a family on potatoes, because, though he may consent to live on them, when he can positively procure nothing else,—habit, custom, the opinion of those around him, have made it in his eyes contemptible, irrational, absurd, for a man to be living on potatoes, when he has the opportunity of getting any thing better. In his hours of prosperity, therefore, he will to a certainty solace himself with bacon, and most probably venture upon beef, and as this absorbs a greater portion of his income in what he views as necessary to his individual existence, it proportionally reduces his disposition to burthen himself with new mouths. If the Irishman had the prospect of all this bacon and beef, he would view it as convertible into potatoes for a family like a patriarch's. The Englishman thinks it but decency to swallow all, and omits the family."

salutary postponement in the average date of matrimony. In a newly-settled country, where there is much good land still unoccupied, the moral preventive check might not be called for. In an old country, where it is called for, but not observed, we are sure to behold a wretched and degraded peasantry. There is no other method by which to raise them above this level, or to prevent their falling into it, than by the rigorous operation of this check. Our peasantry, it should be understood by all, have in this way, though in this way only, their comfort and independence in their own hands. They are on high vantage-ground, if they but knew it; and it is the fondest wish of every enlightened philanthropist, that they should avail themselves to the uttermost of the position which they occupy. It is at the bidding of their collective will, what the remuneration of labour shall be; for they have entire and absolute command over the supply of labour. If they will, by their rash and blindfold marriages, over-people the land, all the devices of human benevolence and wisdom cannot ward off from them the miseries of an oppressed and straitened condition. There is no possible help for them, if they will not help themselves. It is to a rise and reformation in the habits of our peasantry that we would look for deliverance, and not to the impotent crudities of a speculative legislation. Many are the schemes of amelioration at all times afloat. We hold, that, without the growth of popular intelligence and virtue, they will, every

one of them, be ineffectual. This will at length save the country from the miseries of a redundant population,—and this, we apprehend, to be the great, the only specific for its worst moral and its worst political disorders.

21. It is not, however, by a direct promulgation of the doctrines of M^r. Malthus, that the people will be converted to the side of their own interest. We can imagine nothing more preposterous than the diffusion, for this purpose, of tracts on population among the families of the land. The change will be accomplished surely, though indirectly, and by insensible progress, through the means of general instruction, or by the spread of common, and more especially of sound Christian education over the country. There is an indissoluble connection between the moral character and the economic comfort of a peasantry; and the doctrine of Malthus is the *vinculum* by which to explain it. But it is not necessary to point out the vinculum to them. To make good the effect, it is not at all necessary that they should understand its dependence upon the cause. It is enough, if, in the state of their own principles and feelings, they present or provide the cause. Let them only be a well-taught and moralized people; and, in that proportion, will they mix prudence and calculation and foresight, with every step in the history of their lives. The desirable effect will follow without any theory, or any anticipation of theirs. Let it, on the average, be held disreputable to marry without

a fair and adequate prospect or provision ; and the result would be a certain average of later marriages, or a country less burdened with an excess of population. It is thus, that half a century ago, in the Lowlands of Scotland, the habit of a large preparation often required, for its accomplishment, the delay of years after the virtuous attachment was formed—this habit was nearly universal among our well-schooled and well-ordered families. And so, though poverty was not unknown, yet pauperism was unknown; and notwithstanding the general barrenness of our soil, did the moral prevail over the physical causes, and uphold within our borders an erect and independent peasantry. They exemplified the doctrine of Malthus, and realized its benefits, long before that doctrine was propounded to the world.

22. In the mechanism of human society, it needs not, that, to effectuate a given result, the people, who do in fact bring it about, should be able intelligently to view their own part in it. This is not more necessary in truth, than that, to fulfil the beneficent end of the planetary system, its various parts should be endued with consciousness—that the satellites of Jupiter, for example, should understand and design their own movements. The multitude may be wholly innocent of economical science themselves—yet may they exemplify, and by their agency sustain, its most wholesome processes. They may realize the full benefits of an operation which they do not comprehend—though,

in very deed, they were themselves the operators. We object not to the highest possible education of the peasantry—yet it is not to the lessons of the political, but to those of the moral and religious school, that we look for the best and speediest instruments of their economic well-being. Neither teachers nor taught may understand this connection—not is it necessary they should. The main object and the collateral good of Christianity may be indissolubly conjoined—but there are thousands who have verified this conjunction in experience, though they have never viewed it in theory. In labouring for the good of their eternity, they have reaped, by the way, those blessings which religion so abundantly sheds over the pilgrimage that leads to it.

23. All the remedies which have been proposed against a state of general destitution in society, may be classified under two descriptions. By the first, it is sought to provide the adequate means for the increasing numbers of mankind. By the second, to keep down the numbers to the stationary, or, comparatively speaking, to the slowly-increasing means. The first may, we think, be conveniently designated the external remedies—insomuch that their object is to equalize the means with the population, by an increase on the former term, or by an increase and enlargement of the resources from without. The second may, perhaps, be contradistinguished from the other, by viewing it in the light of an internal remedy—insomuch as its object is to

maintain the equality of the two, by preventing an undue increase on the latter term, which can only be achieved, in a right way, by adding to the restraints of prudence and principle from within. It is our main design to demonstrate the insufficiency of one and all the remedies put together which belong to the first class—and to contrast, with their operation, the effect of the moral remedy, the prosperous economic state that will surely be realized through the medium of general intelligence and virtue, or by an action on the minds of the people themselves.

CHAPTER II.

ON THE INCREASE AND LIMIT OF EMPLOYMENT.

1. THE great and immediate demand is for the application of the external remedies ; and, till these have done their uttermost, the feeling is, that the application of the internal is meanwhile uncalled for. So long, it is imagined, as there are still unevoked any possible resources from without, it is yet time to think of a restraint from within. It is readily admitted, that, as cultivation is carried downward through the gradation of soils, the last which has been entered on does no more, in the existing state of our agriculture, than barely remunerate the operations of its husbandry—or, laying capital at present out of the account, than feed the agricultural labourers and their secondaries. And it is farther granted, that, if the last possible limit is ever to be reached, the tendency of the population to increase must either be corrected by the positive, or kept in by the preventive checks ; and that, were the operation of the moral preventive check sufficiently powerful, there might, even in the ultimate state of the world's agriculture, be as high, or a more highly-conditioned peasantry, than at any preceding stage of the world's history. But it is not seen, that, long anterior to this con-

summation, the moral preventive check may be imperiously called for, in order to sustain the comfort and circumstances of the working population. Nevertheless, this moral restraint is desirable *now*, as well as *then*; and that just because the tendency to an increase in the number of labourers far outstrips the tendency to an increase in the productive powers of labour. It is quite true, that, by the inventions of machinery, and the improvements which are ever taking place, both in the methods of agriculture, and the implements of agricultural labour, the poorer soils may, for an indefinitely long period, be made to yield as much, in return for the same work, as did their predecessor soils in the series of cultivation. Yet there is nothing in this to supersede the moral restraint—and precisely because, with every possible enlargement, subsistence *will* not increase, so fast as population *would* increase. And therefore it is, that, notwithstanding all which may be alleged of the still unexhausted capabilities of the soil, either in this or in any other country of the world, we cannot possibly be saved from the *present* and the perpetual miseries of a redundant population, but by a higher taste for the comforts and the decencies of life among the population themselves. This, by its controlling effect on the date of marriage, and so on the largeness and number of rising families, keeps up the price of labour, by keeping down the supply of it in the labour market. This we hold to be the great specific for ensuring a high average style of.

comfort and enjoyment among our peasantry—nor do we regard it as a less wise and beautiful connection in the mechanism of society, that the most direct way to establish it is through the medium of popular intelligence and virtue—giving thereby a practical importance to efficient Christian instruction, unknown to the most of economists, and which no mere economist can possibly realize.

2. But though the progress of cultivation, and the produce extracted by labourers from the last—and farthest margin of it, do truly represent both the progress in numbers, and the state in respect to comfort, of our operative population;* and though, when viewed in this way, the conclusion seems irresistible, that there is a slowly-receding limit to the means of subsistence, on which population is ever pressing, so that if it press too hardly, it must straiten and depress the condition of labourers—yet we hear of a thousand other expedients for an amelioration in the state of the working classes of society, beside the only effectual expedient of a general principle and prudence in regard to marriages, which it is for the working classes of society,

* The produce extracted by that portion of our labourers who are employed at the extreme margin of cultivation, will, after a deduction for profit and taxes, truly represent and measure the general state of comfort among the operative population at large, because an inferiority of condition cannot long subsist between one class of labourers and another, there being a constant tendency to equalization, by the free movements of individual labourers from the employment that is worse remunerated, to the employment that is better.

and them alone, to put into operation. What gives plausibility to these expedients is, that society is so exceedingly complicated a thing;* insomuch

* It has been well remarked by Malthus, in his Essay on Population, that the largeness and complication of a society tend to obscure the truth upon this subject —

“No way is, I believe, almost the only country in Europe where a traveller will hear any apprehensions expressed of a redundant population, and where the danger to the happiness of the lower classes of people, from this cause, is in some degree seen and understood. This obviously arises from the smallness of the population altogether, and the consequent narrowness of the subject. If our attention were confined to one parish, and there were no power of emigrating from it, the most careless observer could not fail to remark, that, if all married at twenty, it would be perfectly impossible for the farmers, however carefully they might improve their land, to find employment and food for those that would grow up, but when a great number of these parishes are added together in a populous kingdom, the largeness of the subject, and the power of moving from place to place, obscure and confuse our view. We lose sight of a truth which before appeared completely obvious, and, in a most unaccountable manner, attribute to the aggregate quantity of land, a power of supporting people beyond comparison greater than the sum of all its parts.” — “From the small number of people, and the little variety of employment, the subject is brought distinctly within the view of each individual, and he must feel the absolute necessity of repressing his inclinations to marriage till a vacancy offer.” — “In countries more fully peopled, this subject is always involved in great obscurity. Each man naturally thinks that he has as good a chance of finding employment as his neighbour, and that if he fail in one place he shall succeed in some other. He marries, therefore, and trusts to fortune, and the effect too frequently is, that the redundant population, occasioned in this manner, is repressed by the positive checks of poverty and dis-

that, when viewed in some one aspect, it holds out a promise of improvement or relief, which, under another or more comprehensive aspect, is seen to be quite illusory. For example, when one witnesses the vast diversity of trades or employments in society, by each of which, or at least in the prosecution of which, so many thriving families are supported, then it is conceived, that the highway for the relief of the unprovided is to find them a trade, to find them employment. Or, when looking to

ease. In Norway, the subject is not involved in the same obscurity. The number of additional families, which the increasing demand for labour will support, is more distinctly marked. The population is so small, that even in the towns it is difficult to fall into any considerable error on this subject, and in the country, the division and improvement of an estate, and the creation of a greater number of housemen's places, must be a matter of complete notoriety. If a man can obtain one of these places he marries, and is able to support a family, if he cannot obtain one, he remains single. A redundant population is thus prevented from taking place, instead of being destroyed after it has taken place."—"There are no large manufacturing towns, to take off the overflowing population of the country, and as each village naturally furnishes from itself a supply of hands more than equal to the demand, a change of place in search of work seldom promises any success. Unless, therefore, an opportunity of foreign emigration offer, the Norwegian peasant generally remains in the village in which he was born, and as the vacancies in houses and employments must occur very slowly, owing to the small mortality that takes place, he will often see himself compelled to wait a considerable time before he can attain a situation which will enable him to rear a family."

These extracts are all taken from the chapter on the "Checks to Population in Norway."

the connection between capital and labour, and perceiving that the office of the former is to maintain the latter—then, on the idea that capital may, by the operation of parsimony and good management, be extended *ad infinitum*, is it held, by almost every economist of high name, that every accumulation of capital carries an addition along with it to the subsistence of labourers. Or again, when one looks to the multitudes supported by foreign trade, in all its departments, the imagination is, that, as agriculture has its capabilities, so commerce has its distinct and additional capabilities, and that, whatever limit there may be to the power of the one for the maintenance of families, this is amply made up by the indefinite extension which might be given to the other. Again, we often hear taxation vaguely, though confidently talked of, as the great incubus on the prosperity of labourers; and that, if this were only lightened or removed, there would thenceforth ensue a mighty enlargement both of industry and comfort to the families of the working classes. And then, in the list of national grievances, we hear of the enormous and overgrown properties which are vested in the few—and a general abundance diffused among the many is figured to be the consequence that would result, if not from the spoliation and forcible division of this wealth, at least from the abolition of entails, and of the law of primogeniture. Or in the absence, perhaps the failure, of all these expedients, emigration is held forth as a sovereign specific for all.

the distresses of an overcrowded land. And, lastly, after every thing but the moral habit of labourers themselves has been thought of, there follows, in this list of artifices for their relief, a scheme which, no longer existing in fancy, has been bodied forth into actual operation, and is the one of all others most directly fitted to undermine the principle and prudence of labourers—even a compulsory tax on the wealthy for the relief of the destitute, so as to disarm poverty of its terrors, and proclaim a universal impunity for dissipation and idleness. Now that this last great expedient has been adverted to, we need scarcely advert to any of those lesser ones, which, though but the crudities of mere sentimentalism, have been proposed, each as a grand panacea, for all the disorders of the social state,—such as the cottage system, and the cow system, and the village economy of Mr. Owen, and the various plans of home-colonization that have been thought to supersede the lessons of Malthus, or, at least, practically to absolve us from all regard to them for centuries to come.

3. Now the remedies we have just specified, may be regarded as belonging to the first class. They are all external remedies; and it will be our distinct aim, to demonstrate, in succession, the inefficacy of each of them. There is not one of them that will serve as a measure of permanent relief. In as far as they hold out the promise of an indefinite harbourage for an ever-increasing population, they but practise a deceitful mockery on the hopes

of the philanthropist. To whichever of the quarters now specified we may, with fond expectation, turn ourselves, we shall speedily be met by a check in every way as difficult to force, as is the last limit between cultivation and barrenness. *To this limit, in fact, one and all of them may be reduced*—and just as really, though not so obviously, in Britain as in Norway. In every society of complicated structure and widely-diversified interests, many are the distinct propositions that might be offered for enlaing the sustenance and comfort of the human species. They can all, however apparently remote and various among themselves, be brought to the place at which husbandry ceases from her operations, because no longer profitable; and there the merits of each may be tried and pronounced upon. That is the place, in fact, though but recently adverted to in the science of political economy, where many a question can be decided, which involves the greatest earthly hopes and interests of society.

4. It may be thought, however, that, without proceeding further in our argument, we might pronounce at once on the scheme of home-colonization. And we trust it is abundantly obvious, that it is utterly incompetent to the end of providing indefinite sustenance for a population proceeding without restraint in the increase of its own numbers. If there be any sanguine enough to imagine, that cultivation may be so speeded forward beyond its natural rate, under the auspices of government, as to absorb all the redundancies of a population,

whom the scheme itself may have helped to emancipate from the checks that would otherwise have restrained them—we would appeal to the mighty enlargement which has taken place in our own land within these few years—the millions which have been added to the inhabitants of Britain and Ireland within the lapse of a single generation. The progress of agriculture during this period, from individual enterprise alone, is quite obvious; and it satisfactorily accounts for the commensurate increase that has taken place in the population. And yet, though a larger, is it a more comfortable population than before? Has the increase of food wrought out any sensible increase on the average sufficiency of families? Have not the absolute plenty in the land, and the relative poverty of the people who live in it, kept pace the one with the other? And if this be all the result of that progress in our husbandry which has taken place under the enterprise of individuals, and has afforded room for additional millions of human beings—can we anticipate a more prosperous result from any government enterprise, which at best will but afford room and sustenance for as many additional thousands? The history of the last thirty years may well demonstrate, that, with a mighty enlargement in our means of subsistence, the population may retrograde, or at least be stationary, in point of comfort, notwithstanding. It affords the clearest experimental proof of the little which can be done by mere resources for an increasing population,

without restraints on the rate of their increase. There was nothing in the vast augmentation which has recently taken place of the one, that superseded the use or necessity for the other. And still less ought it to be superseded by any paltry augmentation of the means *ab extra*, which can be looked for from the scheme in question. The philosophy of Malthus, or rather, the practical wisdom of families, ought not to be suspended, till home-colonization have made full development of the capabilities which belong to it. A reckless population, made more reckless by the show and promise of such a relief, will shoot ahead of all that can possibly be achieved by it. The additional food that may have been created, will be more than overborne in the tide of an increasing population. The only difference will be a greater instead of a smaller number of wretched families—a heavier amount of distress, with less of unbroken ground in reserve for any future enlargements—a society in every way as straitened as before, yet nearer to the extreme limit of their resources than before—in short, a condition, at once of augmented hardship and diminished hope, with all the burden of an expensive and unprofitable scheme to the bargain.

5. We cannot complete our view of the system of home-colonization, without the help of certain ulterior principles, which we shall afterwards apply to the further consideration of this scheme. We shall therefore enter immediately on the proper

subject of our present chapter ; which is, the increase and limit of employment.

6. But before we commence this attempt, it will be necessary to premise a general view of the manner in which the distribution of the labouring classes is regulated by the state of landed property ; and to show how a distinct class of labourers, additional to the agricultural and secondary, arises in the progress of cultivation, and increases in number with every descent which it makes among the inferior soils. Hitherto we have only been attending to the limit of cultivation, where, at the soils last entered upon, the produce is barely adequate to the expenses of the husbandry ; or, abstracting still from the consideration of profit, where the produce could do no more than feed the agricultural labourers and their secondaries. But the produce of the superior soils is more than adequate to this object. The same improvement in agriculture, in virtue of which we now draw a full subsistence for its labourers, from land that had long lain beyond the outskirts of cultivation, will enable us to draw from the fertile land, that had long lain within its boundary, a greater surplus of produce than before, over and above the expenses of the farm management. It is this surplus which constitutes rent,—which, generally speaking, is *measured* by the difference between the produce of a given quantity of labour on any soil, and the produce of the same labour on the soil that yields no rent. It goes in

the shape of revenue to the landlord ; who either receives it in kind, or receives in money the power of purchasing it—a power which, in the act of expenditure, he transfers in various parts throughout the year, to those who labour in his service, or who minister in various ways to his accommodation.*

7. Now, it is this expenditure on the part of landlords, which gives rise to another class of labourers, beside the two that we have already specified. Should the rent but enable the proprietor to provide himself with the necessaries of life—then that part of it, which goes to purchase the first necessaries, would but serve to subsist an idle man instead of a labourer ; and that part of it which went to the purchase of second necessaries, would but serve to discharge additional maintenance, and so give additional extent to the secondary population. But such is the unequal distribution of landed property, and so large are the shares which fall in general to the possessors, that, in the vast majority of instances, the rent can do a great deal more than uphold the proprietor in the necessaries of life. It can enable him to subsist better, and to lodge and clothe himself better, than an ordinary workman. He can afford to indulge in the luxuries of life : and the preparation of these constitutes the employment of a very large population. It will be found very convenient to distinguish them by a particular name, even though we should not for

* See Appendix, Note A.—On the Rent of Land.

this purpose fix on the best appellation. We conceive that the fittest term by which to characterize them, is one descriptive of a circumstance in which their employment differs from that of the two first classes. The two first classes are employed in the preparation of articles which cannot be dispensed with—the preparation of the first and second necessities of life. The others are employed in the preparation of articles which can be dispensed with. A man can want luxuries—he cannot want necessities. He might forego luxuries altogether; and so dismiss from his service the whole of this third class, who are employed in preparing them. Or, he might commute one set of luxuries for another; and so, without dismissing them from his service, he might at least shift their employment in that service. It is this liability of being transferred from one employment to another, and this power, on the part of their employers, of dispensing, if they choose to make a surrender of their luxuries, with their services altogether, which has led me to affix to this class the title of the *disposable*. They form the disposable population, in contradistinction to the agricultural and the secondary.

8. It is for the sake of defining, and not of stigmatising, that we speak of luxuries. By this term we would comprehend every thing prepared by human labour, and which enters not into the average maintenance of labourers. The landed proprietor must at least have the food of other men—but, in as far as, in style and in quality, it is above

that of common labourers, he indulges in luxuries ; and so there are cooks and confectionaries, and many others employed in preparing delicacies for the table, who should have their place assigned to them among the disposable population. He must be lodged as well as other men ; but then, in as far as his house exceeds in magnitude and elegance that of an ordinary workman, for that excess, he must have an additional service of masons, and carpenters, and roofers, and smiths, who, in respect of their contributing to this higher style, belong not to the secondary, but to the disposable population. He must be provided also with furniture and clothing, up to the degree of comfort and tastefulness which prevail among the common people—but, in as far as additional labourers are required, for upholding a higher tastefulness, or a greater abundance, there is a host of tradesmen, and artificers, tailors, and shoemakers, and upholsterers, and cabinet-makers, who must be classified in thousands with the disposable population. We shall not attempt to enumerate the exceeding diversity of employments, which the taste, and the humour, and the artificial wants, and the wayward appetency of the landed proprietors give rise to. It is mainly they who impress on the industry of the disposable population, any direction which seemeth unto them good ; and who, by spending among them their rents, or, in other words, by making over to them the surplus produce of their estates, (or, which is the same thing, by transferring to them the power

of purchasing that produce,) do, in return for their varied services, effuse maintenance upon their families. This disposable population must, like the agricultural, have a train of secondaries attached to them; and receive as much from their employers as shall provide themselves with the first necessaries, and as shall suffice for the food of those who provide them with the second necessities of life. It is not enough that the disposable population are *subsisted*—this would only imply their being fed by their employers. They must be *maintained*, which, in addition to their being fed, implies their being clothed, and lodged, and furnished, in all those secondary accommodations that enter into the average comfort of labourers. The price of their services includes in it the power of purchasing food for themselves, and food for all the secondary labourers who, either mediately or immediately, are employed by them.

9. This completes our view of the distribution which takes place in society of the labouring classes. The agricultural population are employed in providing all with the first necessities of life. The secondary population, in providing all with the second necessities of life. And the disposable population, in providing all who are elevated above the condition of labourers with the higher comforts of life, its luxuries, its elegancies, which are not essential to the maintenance of human beings, but minister to the wealthy an endless diversity of gratifications, and give rise to a like diversity of employments

among the people. It is needless to explain here, how it is that the wages of labour, in all the three classes, are nearly equalized—insomuch, that they who are toiling at the extreme margin of cultivation, and there trying to force a return from soils which had never been attempted before, are equally remunerated for their services, with those who, in the walks of busy artizanship, are ministering to the most refined enjoyments of the wealthiest and the noblest in our land. For this, and for many other doctrines which we pre-suppose, without any exhibition of their proof, we must satisfy ourselves with a reference to the general science of political economy.

10. Here, however, we cannot refrain from observing the connection which obtains between the state of the soil and the state of human society. Had no ground yielded more in return for the labour extended on it, than the food of the cultivators and their secondaries, the existence of one and all of the human race would have been spent in mere labour. Every man would have been doomed to a life of unremitting toil for his bodily subsistence; and none could have been supported in a state of leisure, either for idleness, or for other employments, than those of husbandry, and such coarser manufactures, as serve to provide society with the second necessities of existence. The species would have risen but a few degrees, whether physical or moral, above the condition of mere savages. It is just because of a fertility in the earth, by which it

yields a surplus over and above the food of the direct and secondary labourers, that we can command the services of a disposable population, who, in return for their maintenance, minister to the proprietors of this surplus, all the higher comforts and elegancies of life. It is precisely to this surplus we owe it, that society is provided with more than a coarse and a bare supply for the necessities of animal nature. It is the original fund out of which are paid the expenses of art, and science, and civilization, and luxury, and law, and defence, and all, in short, that contributes either to strengthen or to adorn the commonwealth. Without this surplus, we should have had but an agrarian population—consisting of husbandmen, and those few homely and rustic artificers, who, scattered in hamlets over the land, would have given their secondary services to the whole population. It marks an interesting connection between the capabilities of the soil and the condition of social life, that to this surplus we stand indispensably indebted, for our crowded cities, our thousand manufactories for the supply of comforts and refinements to society, our wide and diversified commerce, our armies of protection, our schools and colleges of education, our halls of legislation and justice, even our altars of piety and temple services. It has been remarked by geologists, as the evidence of a presiding design in nature, that the waste of the soil is so nicely balanced by the supply from the disintegration of the upland rocks, which are worn and pulverized at such a rate,

as to keep up a good vegetable mould on the surface of the earth. But each science teems with the like evidences of a devising and intelligent God; and when we view aright the many beneficent functions, to which, through the instrumentality of its surplus produce, the actual degree of the earth's fertility is subservient, we cannot imagine a more wondrous and beautiful adaptation between the state of external nature and the mechanism of human society.

11. By this mechanism of human society, as far as we have explained it, the exceeding diversity of trades and employments may be accounted for. Even were the barrenness of the land such, that it only yielded food for an agricultural and a secondary population—this distribution would of itself give rise to a considerable variety of distinct occupations; and, under the system of a division in labour, we should have shoemakers, and tailors, and weavers, and masons, and carpenters, and artificers in hardware, and dealers, as well as fabricators, in sundry more articles—making out, on the whole, a pretty copious enumeration of separate callings, with the separate interests belonging to them. But when, in addition to the subsistence of an agricultural and a secondary, there is fertility in the land for the subsistence of a disposable population, the multiplication of trades and employments is thereby indefinitely extended—being as numerous as the caprices of human fancy and taste, or the varieties of human indulgence. It is thus

that, in proportion as the mechanism of social life becomes more complex, it is also all the more bewildering; and, amid the intricacy of its manifold combinations, we lose sight both of the springs and the limits of human maintenance. One very wide and prevalent delusion, more especially, and which has misguided both the charity of philanthropists and the policy of statesmen, is, that the employment in which men are engaged is the source of their maintenance,—whereas, it is only the channel through which they draw that maintenance from the hands of those who buy the products of their employment. This principle has in it all the simplicity of a truism—and yet it is wonderful with what perversity of apprehension, both the managers of a state and the managers of a parish miss the sight of it. Whether we look to acts of parliament, or to the actings of a parochial vestry—we shall find them proceeding on its being the grand specific for the relief of the poor, to find employment for them. Now, unless that employment be the raising of food, it does nothing to alleviate the disproportion between the numbers of the people and the means of their subsistence,—and if there be a limit, as we have already demonstrated, to the food, we may be very sure that this device of employment will not turn out a panacea for the distresses of an overburdened land.

12. But the fallacy to which we now advert, is not confined to the matters of practical administration. It may also be recognised in the theories of

those who have attempted to adjust the philosophy of the subject. In political economy it will often be found, that the channel is confounded with the source,—and hence a delusion, not in the business of charity alone, but which has extended far and wide among the lessons of the science.

13. And yet it is a delusion which, one might think, should be dissipated by but one step of explanation. A single truism puts it to flight. Nothing appears more obvious, than that *any trade or manufacture originates only its own products*. All that a stocking-maker contributes to society is simply stockings. This, and nothing more, is what comes forth of his establishment. And the same is true of all the other trades or employments which can be specified. They work off nothing, they emanate nothing but their own peculiar articles. Were this sure and ample axiom but clearly and steadfastly kept in view, it would put to flight a number of illusions in political science,—illusions which have taken obstinate hold of our legislators, and which to this moment keep firm possession in the systems of many of our economists. They almost all, in a greater or less degree, accredit a manufacture with something more than its own products. The inclination is, to accredit it also with the maintenance of its labourers. In every transaction of buying and selling, there are two distinct elements,—the commodity, and the price of the commodity; of which price, the maintenance of the labourers is generally far the largest

ingredient. Now, the thing to be constantly kept in view is, that a manufacture should only be accredited with its own commodity, and not, over and above this, with the price of its commodity. These two stand, as it were, on different sides of an exchange. To the manufacture is to be ascribed all that we behold on the one side. It furnishes the commodity for the market. But it did not also create the wealth that supplies the price of the commodity. It does not furnish society with both itself and its equivalent. The latter comes from a distinct quarter; and we repeat, that by confounding, in imagination, two things which are distinct in fact, a false direction has been given, both to the policy of states, and to the theories of philosophers.

14. This confusion of sentiment appears in a variety of ways. When one sees a thriving and industrious village, and that the employment of the families secures for them their maintenance, it is most natural to invest the former with a power of command, tantamount to a power of creation over the latter. The two go together; and because when the employment ceases, the maintenance ceases, it is conceived of the former, that in the order of causation it has the precedency. We affirm of a shawl-making village, that all which it yields to society is shawls. We accredit it with this, but with nothing more. But it is accredited with a great deal more, by those who talk in lofty style of our manufacturing interests, and the dependence

thereupon of a nation's support and a nation's greatness. We hold, that if, through the exhaustion of the raw material, or any other cause, there were to be an extinction of the employment, the country would only be deprived of its wonted supply of shawls; but the prevalent imagination is, that the country would be deprived of its wonted support for so many hundred families. The whole amount of the mischief, in our estimation, would be the disappearance of shawls; in theirs, it would be the disappearance of that which upheld an integral part of the country's population. It is forgotten, that though shawls may no longer be produced or brought to market, the price that wont to be paid for them is still in reserve, and ready to be expended by the purchasers on some other article of accommodation or luxury. The circumstances which have brought the manufacture to ruin, do not affect the ability of those who consumed the products of the manufacture. The employment is put an end to; but the maintenance comes from another quarter, and can be discharged in as great abundance as before, on as large a population. Their employment in making shawls was not the source of their maintenance, it was only the channel by which they drew it to their homes. The destruction or stoppage of the channel does not infer a stoppage at the source; that will find for itself another channel, through which all that enters into the maintenance of our industrious families might be effused upon them as liber-

ally as before. We dispute not the temporary evils of the transition. We allow that a change of employment may bring individual and temporary distress along with it. But we contend, that the expenditure of those who support our disposable population will not be lessened, but only shifted, by this new state of things; and that, after the change is accomplished in the direction of their industry, we should behold as numerous a society as ever, upheld with the same liberality in every thing (with the single exception of shawls, and the substitution of some other luxury in their place) that enters into the comfort and convenience of families.

15. But we are further persuaded, that the confusion of sentiment which we are now attempting to expose, has had a most misleading effect on the views and the policy of statesmen. at one time, inspiring a false hope on the promised extension of trade and manufactures; and, at another time, creating a false alarm on the appearance of their decay. Our legislators do ascribe a higher function to trade and manufactures, than that of simply furnishing society with the articles manufactured. They conceive of them as the dispensers of a transcendently greater benefit than the mere use and enjoyment of these articles. There are other and nobler interests associated in their minds with the trade and manufactures of the country, than the mere gratification and convenience which individuals have in the use of their products. This will at once be evident, if we resolve the manufactur-

ing interest into its several parts,—as the shawl-making interest, wherewith our senate would not for a moment concern themselves, if they thought that all which hinged upon it was the supply of shawls—nor the stocking-making interest, if in their opinion nothing else depended on it but the supply of stockings—nor the carpet-making interest, if it involved no other or higher consideration than the supply of carpets—nor the buckle-making interest, if they did not suppose that, beside owing it to the supply of buckles, we furthermore owed the maintenance and wealth of buckle-makers. And the remark may be extended from manufactures to commerce.* We should have had no grave deliberations on the China trade, or the Portuguese trade, or the West India trade, if something far loftier had not been associated with these respective processes, than that of serving the families of the land with tea, or wine, or oranges, or sugar, or coffee, or tobacco. These mighty commercial interests are conceived to be productive of something greatly more magnificent and national; and not only the income of all the capitalists, and the maintenance of all the labourers engaged in them, but the strength, and revenue, and political greatness of the state, are somehow associated with their de-

* In extending the observation from home to foreign trade, we pre-suppose, what we shall afterwards attempt to show more particularly, that the *terminus ad quem* of foreign trade, is the benefit, or enjoyment, administered by the commodities which it imports, to the inland consumers.

fence and preservation. It is forgotten, of each trade and each manufacture, that it furnishes, and can furnish, nothing but its own proper and peculiar articles; and that, abstracting from the use and enjoyment of these, every other associated benefit is comprehended in the equivalent price which is paid for them. All that the wine trade of Portugal, for example, furnishes to our nation is wine; and, in reference either to the public revenue which arises from it, or to the private revenue wherewith it both enriches the capitalists, and supports the labourers employed in it, these are yielded, not most assuredly by the wine, but by the price given for the wine. The wine trade is but the channel through which these flow, and not the source in which they originate. But, notwithstanding, there is yet a mystic power ascribed to the wine trade, as if part of the nation's glory and the nation's strength were linked with the continuance of it. And hence a legislature tremulously alive to the state of our relations with Portugal, lest the wine trade should be destroyed. Now though, from the interruption of these relations, or from any other cause, the wine trade, on the one side, were destroyed, the counterpart wealth, on the other side, would not be destroyed. It would remain with its owners, to be expended by them on the purchase of some new luxury in place of the wine; by the natural price of which, the same return could be made to capitalists and labourers, and by a tax on which, the same revenue might be secured to government as before.

16. It must be obvious, that employment in agriculture is not an indefinite resource for an indefinite population—seeing that it must stop short at the land which refuses to yield the essential food of its direct and secondary labourers. And it should be equally obvious, that as little is employment in manufactures an indefinite resource—seeing that the definite quantity of food raised can only sustain a certain and definite number of labourers. The latter position seems, on the first announcement, to carry its own evidence along with it; yet there is a certain subtle imagination in its way, which we have attempted to dispose of. Our argument rests on the veniest truism—that a manufacture is creative of nothing beyond its own products. But truism though it is, it has been strangely overlooked, not only in the devices of the charitable, but both in the policy of statesmen, and in the doctrinal schemes of the economists. Yet we think a sufficient explanation can be given, both of the manner in which the perverse misconception at first arose, and of the obstinacy wherewith it still lingers and keeps its ground amongst us.

17. In opposition, then, to the principle, that employment is creative of nothing but its own products, it might be alleged, that the presentation of these products excites a desire for the acquisition of them, and so stimulates other employments in the fabrication of new products, to be given in exchange for the former ones. It was remarkably exemplified throughout the whole of Europe, at the

termination of the middle ages. Of this we have a masterly sketch by Dr. Adam Smith, in his *Wealth of Nations*;* when he traces the great economic change which took place, in virtue of a new taste and a new habit on the part of the landholders. Historically, it was the presentation to their notice of those articles of splendour and luxury which manufactures had produced, and which commerce brought to their doors, that prompted the change. This was the moving force, which shifted their old expenditure, and gave another direction to it. They dismissed their idle retainers, and appropriated the surplus produce by which they had been fed, to the purchase of luxuries in dress, or of luxuries in equipage and furniture. They furnished subsistence to as many as before, but in a new capacity, and in return for a different service. The disposable population were differently disposed of. Instead of so many idle marauders, living, save at their seasons of warfare, in sloth and sordidness, on the domain of their feudal lord, they were transmuted into orderly, industrious citizens—as dependent, for the first necessities of life, on the country as before, but yielding, in return for these, not the homage of their personal attendance, but the tangible produce of their own handiwork. And along with this economic, there was effected a great moral change in the state of society. The contests of violence between adjoin-

* And by Dr. Robertson, in the Introduction to his *History of Charles V.*

ing proprietors, were exchanged for the more peaceful contests and rivalships of vanity. The hundreds, who in other days would have followed them to the field, on services of revenge or plunder, were now at peaceful occupation in their workshops—congregated into villages, which grew into cities, and there placed under the protection of law and social order. Liberty, and justice, and civilization, and right government, all emerged from this altered condition of things; and when we reflect, that commerce was the prime mover in this great transition, by the new desires which it infused, and the change which it effected in the style of living and habit of our landlords—it must be allowed, that, historically, to commerce we owe benefits of a much higher order, than the mere gratification of any of the physical or inferior appetencies of our nature.

18. But there is still another reason (beside the new direction given to the expenditure of landlords) why commerce might be said to have been creative at that period of more than their own immediate products. When the landlords parted with their idle retainers, and they were compelled to be industrious for their livelihood—along with a new habit of indulgence among the proprietors, there sprung up a new habit of industry among the people. At one and the same time, the proprietors became more luxurious than before, and the people became more laborious than before. Even these latter participated to some degree, in the taste of their supe-

riots, and were willing also to make their sacrifices, that they might be admitted to their own humble share in those recent gratifications which were beginning to be placed too within reach of the peasantry, and were every where raising the standard of enjoyment. They accordingly made sacrifice of their indolence and love of ease, even as the grantees above them made sacrifice of their power and parade of attendance. At the same time, the rights of all were beginning to be more recognised and respected; and, under the administration of more benign and equitable laws, the poor man felt a greater stimulus to labour than before, in the greater security which he now had for the possession and enjoyment of its fruits. And then the severe and regular industry of manufactures, was followed by a more severe and regular industry than heretofore in agriculture. The desire of each man to better his condition, now began to develop its energies in all the classes of society. Landlords, with a larger and juster sense of their interests, disposed of their farms in the way that yielded the greatest revenue to themselves; and husbandmen, with the benefit of a now more industrious peasantry, so laboured the farms, as to work out the greatest remainder of produce for themselves. In addition to this, the business of the country participated, though never to such a degree, with the business of towns, in the benefits that result from the division of labour, and in the greater power given by mechanical invention to the im-

plements of labour. Altogether, the limit of cultivation, under the operation of these various causes, has receded an immense way back within these three centuries. Millions of acres, that, under the old *lazzaroni* system, had never been entered on, are now yielding subsistence to man; and the increase of food has been surely and speedily followed up by an increase of population. The land of inferior soils, that formerly yielded nothing, is now productive; and the land that formerly produced, is now, in virtue of deeper and more laborious culture, of tenfold greater fertility than before. Now, in Europe, all this may be in a great measure traced to the reaction of commerce upon agriculture. It was commerce which gave the impulse; and, in addition to its own products, it, through the medium of the new system of society which it introduced, called forth products from the earth, that, but for it, might never have been extracted. In this instance at least, commerce seems to have been the creator, not of its own commodities alone, but of the equivalents for these commodities—a fountain-head, not merely for the products of its labour, but for the maintenance of its labourers.

19. It is not to be wondered at, then, that he who traced with so graphic and powerful a hand the reflex influence of commerce upon agriculture, should have sometimes forgotten the natural order of precedency betwixt them. He certainly did more than any of his predecessors in the science,

in restoring to agriculture the proper honours and ascendancy which belong to her. Yet he does give a power to the enterprise and the accumulation of merchants, which neither experience nor the nature of things will justify. None was more successful than he, in exposing the crude imaginations of those who thought to enrich the country by means of a restricted commerce. But along with this, he greatly overrated the effect of an emancipated commerce, or of commerce set at liberty from its fetters. He very clearly demonstrated the impolicy of those artificial checks, which, in the shape of monopoly or prohibition, had been laid upon trade. But he seems not to have been fully aware of the natural check which stands in the way of its indefinite extension—and by which a gradual retardation, and ultimately an immovable arrest, are laid on the progress of agriculture, and of population, and of capital, and so of commerce. The truth does appear, throughout the work of this great author, in occasional glimpses—but not so explicitly, or with such application and effect, as it would have done had the doctrine of population been understood in his day. This single element alone would have modified a number of his conclusions; and, more particularly, he would not have held out to society the promise of an endless advancement, as if every effort of parsimony, and every accumulation of capital, were infallibly to speed it forward. He seems to reason as if the simple act of preparing commodities, and placing

them as it were on one side of an exchange, will, through the operation of stimulus, call forth into existence equivalent commodities on the other side of it. This process, it is true, was conspicuously and memorably exemplified, at that period in history, which may be characterized as the period of transition from the middle to the modern ages of Europe. But that was no sufficient cause, why it should have been regarded and reasoned upon as the universal process for all ages.

20. There is, in truth, a wide difference between the state of things at the commencement, and after the full establishment and continuance, of this new era. Then the passion for war had just given place to the passion for wealth and luxury; and this latter passion, when newly awoke, found a soil of boundless and yet unentered capabilities on which to expatiate. The rude and infant husbandry of Europe had a mighty career before it, along which the increasing products of commerce met with their sure return in the increasing products of agriculture. The spirit of mercantile adventure could safely indulge in every variety of caprice and speculation; for the unsated appetite of the landlord found, in the before untouched resources of his land, the means of extended gratification. Commerce appeared to anticipate agriculture, and might almost have ventured in reality to do so, yet not be disappointed; for however it multiplied its wares and its whimsies, it found a ready admission for them in the growing wealth, and the now stimu-

lated fancy and taste of its country customers. It is really not to be wondered at, that men should have been led to imagine, as if commerce had a commencing and a creative virtue in this process ; and that it had only to accumulate, and to employ, and to produce, in order to carry forward the prosperity of the nation with uniform, or with accelerated progress. Commerce, in fact, was the prime, the executive agent in Europe, for unlocking the capabilities of the soil ; and, at a period when these were rapidly evolved, the articles which it fabricated and brought to market seldom failed to meet with purchasers of sufficient wealth and sufficient number ; and so also with a price which enveloped in it the profit of all the capitalists, the comfortable subsistence of all the labourers. It was most natural, in these circumstances, to conceive of commerce as an *efficient cause*, not merely for the commodities of its own workmanship, but for the maintenance of its own workmen ; and, if agriculture was not just made of subordinate rank to commerce, commerce was regarded as of fully co-ordinate rank with agriculture. Nevertheless it will be found, we think, on further consideration, that however events may have fallen out historically in the order of time, there is an order of nature, and an order of influence, which must be attended to, ere the essential relations of agriculture and commerce be rightly understood. We hold the real dependence of the latter upon the former, to be a truth of capital importance in political economy ;

and that, if steadfastly kept in view, and carried forward to its legitimate applications, it would put to flight a number of those delusions and errors which, in the course of speculation, have gathered around the science.

21. One plain distinction, and a distinction not to be overlooked by the slight exceptions which can be alleged against it, is, that to agriculture mainly we owe the necessaries of life; whereas, many of its luxuries cannot be had without commerce and manufactures. This is a most momentous distinction, and a vast deal turns upon it. We not only see in it, that manufactures must necessarily, in point of extent, be limited by the produce of the soil; but that the owners of the soil, in virtue of the property which belongs to them, have a natural superiority over all other classes of men, which by no device of politics or law can be taken away from them. The holder of what I cannot want, is the master of my services. He can impress upon them any direction which seemeth unto him good. He can transfer his demand from one luxury to another; and so, as far as his consumption goes, he can extend one manufacture at the expense of a proportional abridgment on another manufacture. Or, he can part with the use of some tangible commodity altogether, and, with the price which went to purchase it, may obtain for himself the use of a menial servant; and, in so doing, he effects an absolute reduction in the manufactures of the country. Or, whether in the spirit

of a voluntary patriotism, or in submission to lawful authority, he may render to the state the price of many luxuries ; and thus withdraw so many of the disposable population from the business of trade, to the business of our national establishments. It is thus that any given change in the taste or habit of our landlords, would effect a corresponding change in the employment of the great mass of our disposable population. They are virtually the holders of the maintenance of this class of labourers ; and it is their collective will which fixes the direction of their labour. Apart from the importation of food, there can be no more labourers in the country than the produce of their estates will subsist. It is the quantity of this produce which fixes the amount of labour ; and as far as the labour of the disposable population is concerned, it is the will of the holders of this produce which fixes the direction of it. They are the natural masters of the country ; and the ascendancy wherewith their property invests them, hinges on this clear and simple distinction—Men can want luxuries ; they cannot want necessaries.

22. But more than this. Every increase of food is followed up by an increase of population. It is not so with any other manufactured goods, save in as far as that may work an increase of food, by pushing on the limit of cultivation in the way that we have already explained. Such, at all events, is the difference between the two sorts of produce, that the market cannot permanently be overladen

with corn, even though its growers should persist in keeping up and increasing the supply of it. Unlike to all other articles of merchandise, an increased supply of food is surely and speedily followed up by an increased demand for it. It may be a drug in the market for a year or two; but though it should continue to be sent, in the same, or in superior abundance, season after season, it will not remain so. The reason is, that, unlike to other commodities, it creates a market for itself. Through the medium of the stimulus given to population, it does what no other articles of merchandise can do—it multiplies its own consumers. A plenty of the first necessities, is the only species of plenty which surely and largely tells on the population. A plenty of luxuries has no such effect; and not even a plenty of the second necessities, as shoes or stockings, or the materials of house-building. The proprietors of the first necessities are on the only sure vantage-ground. They alone have nothing to fear ultimately from the indefinite supply of their peculiar commodity. The produce of agriculture may be made to increase, up to the uttermost limit of its capabilities; for, whatever the additional number may be which it can feed, that number will rise to be fed by it.

23. We can therefore be at no loss to perceive, how an indefinite supply of the products of agriculture, must be followed up by a like indefinite supply of the products of manufactures or commerce. The people whom it feeds, give, in their

handiwork, a return for their subsistence. But this does not hold true of the reverse proposition. The products of manufactures do not *indefinitely* call forth the products of agriculture. They did so historically, at that period when they effected a change in the taste and habit of landlords. They still do so gradually, when, in virtue of their greater supply by an improvement in the powers of labour, they reduce the numbers of the secondary class, and so push cultivation further among the inferior soils. But beyond this limit they have no power. An increase of agricultural produce will, through the medium of an increasing population, be followed up, *pari passu*, by an increase of manufactured commodities. But a mere increase of manufactured commodities, cannot force the existing barrier in the way of cultivation, or force an entrance upon that land which is not able to feed its agricultural labourers and their secondaries. There is one way in which this barrier may be made to retire. Labourers may consent to be worse fed than before, or to put up with fewer of the secondary accommodations. If, with this reduction in the standard of enjoyment, they still work as hardly, or, if even with the same, and perhaps a higher standard, they are willing to put forth more than their wonted labour—this might widen the limits, and so multiply the products of agriculture. Still, after these modifications are admitted, there is a wide difference between agriculture and manufactures—the former influencing the latter, in a way that the

latter cannot influence the former. Agriculture, with every permanent increase of its products, can, through the medium of an increasing population, command a like increase in the products of manufactures. Manufactures cannot, by any increase of their products, while the standard of enjoyment, and the powers of personal and mechanical labour remain the same, force a like increase in the products of agriculture.

24. This distinction between agriculture and manufactures, would serve greatly to modify the reasonings of Dr. Smith, when, without reference to any such distinction, he tells of one species of commodities stimulating the production of another species of commodities. It follows not, because commerce had the power, by tempting landlords from an old to a new habit of expenditure, of extorting additional products from a soil whose capabilities had scarcely been entered on; it therefore has this power, when agriculture, with its stationary or slowly-receding limit, has either reached, or is so much nearer the uttermost length to which it can be carried. The stimulus might be as powerful as before. There might be as intense a desire for the increase of enjoyments, whether they be the enjoyments of pleasure, or those of pageantry. But this moving force is in contact now with an obstacle which stood then at a distance so remote, as to have permitted an advancing movement, and that a tolerably free one, for several centuries. We now begin to feel, and may indeed be said to

have long felt, the utter powerlessness of mere production in manufactures, to enlarge the wealth, or speed forward the economic prosperity of a land. What commerce did in an incipient, it cannot do in an extreme state of agriculture ; and in the oldest and richest countries of Europe, the sanguine, the splendid anticipations which the earlier experience awakened, checked and chastised as they have been by the later experience, are now beginning to be abandoned.

25. But not only is there a visionary hope associated with this contemplation,—there is also an alarm which, it is comfortable to think, is alike visionary. They who so count on the reaction of a stimulus, as to imagine, that every addition beyond their present extent to our manufactures, will give a proportional enlargement to our agriculture, might also imagine, that every subtraction beneath their present extent from our manufactures, will proportionally lessen and contract our agriculture also. The two imaginations, in fact, are products of one and the same fallacy. He who thinks that it was the creation of a manufacture which stimulated and called forth an increase of agriculture, may well be apprehensive lest the destruction of the manufacture should as much throw the agriculture back again. Now, it is not so. Though a particular manufacture should be brought to ruin, and the employment in it should cease, the counterpart maintenance will not cease ; and our security against this effect is, that there would still remain

a sufficiency of objects, on which it were not only possible, but felt by the landlords to be desirable, that they should still spend their incomes. There is not a luxury that can be named, the loss of which would cause our agriculture to go back; even though, historically, it may have been the first presentation of that luxury to their notice, which, by its effect on the appetency of landlords, helped to bring the agriculture forward. Now that the revulsion has taken place from the habit of the middle ages, there is no danger of the surplus produce of their estates lying idle in their hands. They will set their hearts on as large a revenue as before; and notwithstanding the ruin or disappearance of many separate trades, they will still find use for it all. In other words, amid the numerous failures and fluctuations of employment, they in the meanwhile will not let down the cultivation of a single acre; so that there shall remain as large a maintenance for the same population as before. The expenditure of its holders would be changed, but not lessened. The destruction of one manufacture would be followed up by the creation or the extension of another; or there would be a proportionate addition to the revenue of our landlords. At all events, we should behold as large a disposable class as well supported as ever. It may be Utopianism to expect, that beyond the limits of our present agriculture, there lies before us a career of endless and ever-advancing prosperity; but we might at least give up all our sensitive alarms,

lest, by any revolution in the trading world, our prosperity shall ever be sensibly and permanently reduced beneath that limit. So long as we have law and liberty amongst us, our economic resources will be found as stable as the constitution of the seasons or of the soil. Unless we are struck from Heaven with the curse of barrenness, the present means of our subsistence will remain to us. We may have little to hope from a great enlargement of these means, yet have every thing to hope from a right distribution of them.* There may be, there is, an impassable limit to the physical abundance of our products. There is no limit to the moral cultivation of our people. We may not be able greatly to increase our stores; but with the stores we have, a mighty achievement remains to us. We may indefinitely increase the virtuous and prudential habits of the community; and on these mainly, on these we should say exclusively, it depends, whether there shall or shall not be a high average of sufficiency and comfort among the families of the land.

26. It is now high time that the statesmen and philanthropists of the old world should take this direction. It is to a moral restraint on the numbers of mankind, and not to a physical enlargement of the means for their subsistence, that we shall be henceforth beholden for sufficiency or peace in our commonwealth. It is from the power of Christian education, and not from the devices of the economists, that our deliverance is to come. And yet

we abide almost as reckless of this truth, as if in the morning of our history we had still the world to begin, or had still in reserve a land of boundless extent and fertility, on which, as in America, we might expatiate unchecked by any barrier of physical necessity for many generations. To employ the language of the schoolmen, we are still looking objectively to the enlargement of resources in the outer world of matter, instead of looking subjectively to the establishment of habit and principle in the inner world of mind. Yet thence, and thence alone, will proceed our help and our emancipation from the miseries which beset and straiten us; and nothing will more effectually demonstrate the supremacy of the moral over the physical, in the system of human affairs, than will the ameliorated condition coming in the train of ameliorated character, after the tried impotency of all other expedients.

27. Meanwhile, as the difficulties thicken, and the pressure becomes more severe, the expedients multiply. This is a teeming age for all sorts of crudities; and we have no doubt, that our very nearness to the ultimate and immoveable barrier of our resources, has made the necessity to be all the more intensely felt, and so given additional impulse to the speculations of philanthropists. Among others, the favourite device of employment has been acted on to a very great extent; though its inefficacy as a resource, one might think, should be abundantly obvious, on the simple axiom, that

employment is creative of nothing but its own products. It was a far more rational and likely expedient centuries ago, in the earlier state of our agriculture, than it is at present; nor need we wonder, though in these days they should often have experienced a most convenient absorption of poverty and idleness in whole masses, simply by providing and dealing out work. There was room then for such an absorption, when the increasing products of the towns and villages could be met by the increasing products of a land, whose capabilities were yet so far from being fully overtaken. We accordingly meet with this expedient in the innumerable parliamentary acts of other days, for the suppression or the regulation of mendicity; and it was long the favourite scheme, both of parochial counsellors, and of individual philanthropists. The general rule of society is, that each man lives by his business; and the first natural imagination is, that this conjunction between work and maintenance is just, in every instance where poverty and idleness are seen together, to be repeated over again. England is rife with this experiment throughout her teeming parishes; and quarrying, and road-making, and breaking stones, and digging in gravel pits, and the manifold branches of in-door labour in work-houses, have all been devised; that, if possible, by the products of their industry, their surplus people might earn for themselves their subsistence, or a part of their subsistence. The conception is prevalent all over, and has been endlessly

diversified into various ingenuities, alike amiable and abortive. The platting of straw, and picking of hemp, and various sorts of millinery and hand-manufactures, have all been tried and found wanting. The effect is a general depression in the price of the prepared article, whatever it may be; or if the article be altogether new, the purchasers who are allured to it, are withdrawn from the purchase of other articles. On either supposition, a whole body of regular labourers are impoverished by the weight of these additional products upon the general market, and so utterly fruitless indeed has it turned out as a permanent resource, that, in despair, the expedient has been abandoned in many parishes, and the extra population are suffered to lead a kind of lazzaroni life in idleness, and in the mischief and crime which are attendant upon idleness. The truth is, that if home-colonization fail, employment in manufactures is far more likely to fail. By the former, a certain portion at least of sustenance, is drawn from the earth in return for labour—though inadequate to the full maintenance of the labourers. By the other, something is produced too, but it is not sustenance; but a commodity to be offered in return for sustenance; and which cannot earn that sustenance for additional labourers, save at the expense of all previous labourers. The home-colonist, at work among the inferior soils, may perhaps extract from them three-fourths of his maintenance, and leave the remaining fourth a burden upon society. The workman

in a chaity manufacture, burdens society with the whole of his subsistence. The article he prepares becomes cheaper and more plentiful than before ; but he himself becomes the instrument of a general distress, by inducing a dearness and a scarcity on that which is most essential to families.*

* See Appendix, B.—On Machinery.

CHAPTER III.

ON THE INCREASE AND LIMIT OF CAPITAL.

1. WE use the term *capital*, in the sense which is assigned to it by the great majority of our economists; not as comprehending all material and monied wealth, but only that part of it which is employed in the business of production, and is generally so employed for the purpose of obtaining a profit. Stock is the generic term, of which capital forms only a part. Were a manufacturer to take account of his stock, he would put his dwelling-house, and his furniture, and his clothes into the inventory, along with all other things which belong to him; but his capital we should restrict to his machinery, and the houses which contain it, and his implements of labour, and the amount of money which he reserved either for the repairs of his trading establishment, or the payment of his labourers. They are these, and not his dwelling-house or furniture, which obtain for him the profit that constitutes his revenue. By laying up part of this profit, instead of spending the whole of it, he may add to his capital; and we hold it one of the most important inquiries in political economy, what the circumstances are which promote or limit

the augmentation of an element that enters so largely into the views and reasonings of the science.*

2. Capital behaved to make an early appearance in the history of human society. The rudest implement that was first used in preparing the ground for the reception of seed, possessed all the essential attributes of capital. If, by the direct application of human hands to the soil, the requisite treatment of it could have been as easily effected, as with the intervention of tools and instruments, these latter would never have been employed. But the contrary of this was soon found ; and when the branch of a tree was broken off, and rightly fashioned for scratching the surface of the earth, even at this rudimental stage do we behold the application of capital to agriculture. This primitive expedient for facilitating human labour, and making it more effective, exemplified the functions and the benefit of capital as distinctively, as do the spade or the plough that have superseded it, or as does all the various and complicated apparatus of modern husbandry.

3. Having, for the first time, introduced the element of profit to the notice of our readers, we think

* Capital, as an instrument of production, is conceived to be bound up by means of agricultural improvement, with every piece of land, on the permanent amelioration of which, certain sums have been expended. And that part of the produce, which would have been yielded independently of this improvement, is ascribed, not to the capital which has been laid out upon the farm, but to the original powers of the soil.

it right to premise this part of our argument, with two distinct notices regarding it.

4. The first is, that though profit enters as a distinct ingredient into the price of every article, yet that article may be supplied in far greater abundance, and, as it regards manufactured commodities, may be afforded far more cheaply to the consumer, than if there had been no capital applied to the production of it, and, consequently, no room for the imposition of such a charge. Even though it should require the constant labour of one man to make and to repair a plough, and the constant labour of another to use it, yet if, with one plough, as great an amount of work can be performed as with the mere handiwork of ten men, then, out of the maintenance of ten men, a liberal profit might well be afforded to the capitalist, and a large surplus produce, over and above, be afforded to the country. It is thus that capital, in the shape of farm-utensils of various sorts, by opening a descent to inferior soils, has inconceivably augmented the produce of the land, and so enabled it to maintain a vastly larger population. And furthermore, capital, by superadding mechanical to manual labour, has so augmented the amount of manufactured articles, that, notwithstanding the charge of profit to which it has given rise, both the luxuries and the second necessities of life are furnished in much greater profusion, as well as greater cheapness, to society.

5. Our next notice in regard to profit is, that it

has the effect of attaching the services of the disposable population to other masters, beside the mere landed proprietors. We believe, that, in a country constituted like ours, the latter will engross by far the largest proportion of these services. Yet every man elevated above the condition of the working classes has, more or less, the command of them. Every man whose expenditure reaches higher than the necessaries of life, has a certain amount of enjoyment ministered to him, by one or more of the disposable population. Their office is the preparation of luxuries; and, when one looks to the style, and the splendour, and the establishment of merchants and manufacturers, it is obvious that they are admitted to a considerable share in the services of this class, along with the proprietors of land.

6. With these preliminary remarks, we may now inquire—What the real power of capital is for the maintenance of a people? There is nothing more constantly affirmed, in the writings of political economists, than the connection between these two elements:—"The power of a country to maintain a population, is in proportion to its capital." "Increase the capital, and you increase its power to employ and to remunerate labour." "Capital is the fund, out of which the wages of labour are paid, and labourers are supported." These are so many different expressions for an oft-repeated aphorism in political science. Now, capital is the fruit of accumulation; and one might be led to imagine, from such representations, as if the fru-

gality of merchants were the primary fountain-head, whence issued forth all the comfort and subsistence of labourers. At this rate, indefinite parsimony would be followed up by the indefinitely-augmenting power of maintaining labour; and, through the medium of personal economy, an unobstructed highway would be opened to increasing and successive enlargements in the amount of the population, or in the general sufficiency of their circumstances. This is the unequivocal impression given by the reasonings of Dr. Smith, on the subject of capital, and the methods of its increase.* There are checks to this progress, which he has either altogether overlooked, or at least forborne to dwell upon, and bring prominently forward. The rationale of a country's advancement in wealth and

* "Every prodigal appears to be a public enemy, and every frugal man a public benefactor."—"Parsimony, and not industry, is the immediate cause of the increase of capital."—"Parsimony, by increasing the fund which is destined for the maintenance of productive hands, tends to increase the number of these hands"—"By what a frugal man annually saves, he not only affords maintenance to an additional number of productive hands, for that of the ensuing year, but, like the founder of a public work-house, he establishes, as it were, a perpetual fund for the maintenance of an equal number in all times to come."—*Wealth of Nations*.

These, and similar passages, taken together, certainly give the impression of an indefinite power, in indefinite parsimony, to carry the capital of a country, and its power to maintain labourers, beyond any limit which can be assigned. This has, accordingly, been contended for by several of Smith's commentators, in formal and express argument.

economic prosperity, has thus been misconceived. The limits, placed by nature and necessity in the way of this advancement, have not been sufficiently regarded ; and more especially has it been thought, that there was a creative and an emanating power in capital, which could overleap these limits, and form a guarantee against all the evils that have been ascribed to redundant population.

7. And on this subject, too, we might learn a lesson at that place in the science, where so many other of its lessons are to be gathered—even at the margin of separation between the cultivated and the uncultivated land. We have already seen, that cultivation cannot be speeded forward beyond this margin, at a rate faster than the improvement in the powers of labour enables the land of next inferior quality to feed the agricultural labourers and their secondaries. If, by an undue increase of population, the cultivation is forced a greater way than this, then the land last entered on is not able to repay its cultivation, and distress is felt in the country because there are too many men. But as surely as there might be too many ploughmen, so there might be too many ploughs. If, in virtue of the excessive number of ploughmen, all cannot find employment, without forcing an entrance upon soils that would return inadequate wages for the labour, so, in virtue of the excessive number of ploughs, all cannot find employment, without a like return of inadequate profit for the capital. Nay, profit forms such a fraction in the price of

most articles, that a large fluctuation of price might not only diminish profit, but annihilate it, or even, by the conversion, as in algebra, of positive into negative, might transmute the profit into loss. It appears from this instance, that just as agriculture might be overladen by an excess of labour, so might it be overladen by an excess of capital. And at the extreme boundary of cultivation, might there be distinctly seen the operation of that check which opposes the indefinite advancement of both. Diminish the wages of agricultural labour beneath a certain rate, and ploughmen will cease to be multiplied. Diminish the profit of agricultural capital beneath a certain rate, $\bar{\pi}$, still more surely, annihilate profit, and ploughs will cease to be multiplied. Both the population and the capital are here brought alike to a stand; and, at the point now specified, both are alike impotent for the purpose of enlarging the wealth of the country. The boasted power of capital for the maintenance of labour is, in this instance at least, found to be an illusion. There is no virtue in the excess of ploughs to maintain the excess of ploughmen. Nothing but an adequate return from the soil can uphold either; and for want of this, each excess must at length disappear,—it being as true of the capital as of the population, that it is heavier than the land can bear.

8. Now, what is true of agricultural, is true also of manufacturing capital. If, as we have found already, there may be too many manufacturing

labourers, so may there be too many manufacturing implements of labour. On the former taking place, there is work done by human hands, without the return of an adequate human subsistence; and so a diminution of the population. On the latter taking place, there is work done by pieces of machinery, without the return of an adequate profit to their owners; and so a diminution of their capital. What is true of the living, is true of the inanimate instruments; both might be unduly multiplied. As there might be too many men, so might there be too many machines—too many power-looms, as well as too many weavers at hand-looms—too many cotton-mills, as well as too many cotton-spinners. There is a check to the one, in the lessening of wages; and in every way as sure a check to the other, in the lessening of profits. They have not looked far onward, who speak of the power which lies in capital to employ and to maintain labour. They have looked only to the first step in the process—that at which the capitalist enlists workmen into his service; and for one year, or one term, can pay them liberally and well. They have not looked to the second step—that at which the return is made by them who purchase and use the commodity that has been thus manufactured. If this return be not an adequate one, the capital is not replaced; and, after a single revolution of the economic cycle, it again starts in diminished magnitude, and with a proportionally diminished power for the maintenance of labour.

9. There has recently been proposed a just and felicitous distinction, between the work done by human hands, and that done by tools, or machinery of any sort. The one is called the product of immediate, the other the product of antecedent labour. Under this view or conception of the matter, it will perhaps be more readily seen, that there may be a redundancy of capital, as well as of population. In respect of there being more of both, than there can be obtained any adequate return for, there is a complete identity between them. If there may be too much of immediate, so also may there be too much of antecedent labour, brought to bear both on agriculture and manufactures. Agriculture cannot be extended, unless the additional land that is taken in, be able not only to feed the ploughman, but also the makers of the plough. A manufacture cannot be extended, unless the additional commodity produced, will more than exchange for the maintenance both of the workers of the machine, and the makers of the machine that is employed. In each case a return must be yielded, which shall both maintain the immediate labourers, and also remunerate the outlay that was expended in maintaining the antecedent labourers. There is occasionally an excess of both: and the effect, in the one case, is the distress and diminution of workmen; in the other, the distress of capitalists, and the diminution of capital.

10. The reasoning is just as applicable to money,

as to material capital. There is nothing in the intervention of this new element to affect our conclusion. Money, when consisting of the precious metals, is itself viewed as a commodity. It may rather be regarded, as that which possesses the property, or the power, of lifting all commodities; or, under the very general aspect, of being that which enables its possessor to lift by purchase any commodities which may be presented, or which may be had for sale: the quantity thus lifted depending on the relative value which obtains between the money and the commodity in question. It is of no consequence to any inference of ours, whether gold or paper be the instrument of exchange, or, in other words, what the *substratum* of money is; of as little consequence, truly, as what the material is on which an order for payment shall happen to be written. Enough that it is an effectual order; and, however interesting the other questions may be, which relate to currency and its fluctuations, it is sufficient, for the determination of our particular question, that the existing currency, whether paper or metallic, possesses, for the time being, a certain power of lifting all such articles as are presented in a market; and so has the substantial functions of a circulating medium.

11. Let us now imagine the sum received by any merchant or manufacturer, at his great annual sale, to be eleven thousand pounds; of which he allocates one thousand to the expenses of his family, and reserves ten thousand for the continuation of his

business. This latter sum he may be conceived to lay out in the repairs of his material capital, and in the maintenance of his workmen, who repeat the course of the by-gone year—that is, work up the same commodities for their employer; and which, if he again sell them for eleven thousand pounds, will enable him to start with the same advantage, and to enter on another rotation, in precisely the same circumstances as before.

12. The length of such rotations varies exceedingly in different trades, though they may all be generalized into one summary expression; and the world of trade may be conceived to revolve in what we shall call an economic cycle, which accomplishes one revolution, by business coming round again, through its successive transactions, to the point from which it set out. Its commencement may be dated from the point at which the capitalist has obtained those returns, by which his capital is replaced to him: whence he proceeds anew to engage his workmen; to distribute among them, in wages, their maintenance, or rather, the power of lifting it; to obtain from them, in finished work, the articles in which he specially deals; to bring these articles to market, and there terminate the orbit of one set of movements, by effecting a sale, and receiving, in its proceeds, a return for the whole-outlays of the period.

13. There is nothing in the intervention of money, which should disguise the real character of this operation. If landed proprietors be the chief

customers for the commodities in question, they do not just give, on the instant, the *ipsa corpora* of their wealth; but they give what is equivalent, a lifting power to a certain extent, or an order to a certain amount, for the produce of their land. This passes from the hand of the capitalist to the hand of his workmen; and they, on presenting it at a shop or a market, just get in food, that chief article of maintenance, the proper and essential return for their labour. It must be obvious then, that principally with the holders of this maintenance, is lodged the power of replacing the outlays of the capitalist. His power to uphold, and still more to extend production on the one side, is mainly dependent on their power of affording him equivalents for his products upon the other. Economists have looked too exclusively to the accumulations of the merchant, as if these could indefinitely advance the wealth of a land. They have not enough considered the nature or the limits of that replacing power, which lies in the hands of his customers. They have calculated too much on his ability to produce, without at the same time calculating on their ability to purchase. It is thus that the check to the augmentation of capital, has not been sufficiently kept in view; and the most sanguine and splendid anticipations have been indulged, respecting the progress of society, without sufficient regard to those immovable barriers which nature and necessity have placed in its way.

14. In the first place, it is abundantly obvious,

that mere accumulation by merchants or manufacturers, can only go a certain way, and, without the concurrence of other causes, must be speedily arrested. The capitalist of ten thousand pounds, who, upon its whole outlay, has eleven thousand pounds returned to him annually, can afford to spend a thousand pounds in the year, and to maintain, in a stationary condition, the principal which belongs to him. But it may happen, that the taste for accumulation shall prevail over the taste for splendour or comfort. Let him reduce his yearly expenditure from a thousand pounds to eight hundred, and he will be able to vest an additional two hundred pounds in his business. And he may succeed by this, in realizing a proportional increase of revenue, seeing that no individual parsimony of his can sensibly affect the general rate of profit in the country. But suppose that the same passion for accumulation should seize upon all the capitalists in the land. Let the whole sum invested by them in trade be ten millions; and their united revenue, with a profit of ten per cent. will be one million. Should all this revenue be spent, both the capital and the profit will remain stationary. But if, in virtue of the change which we now imagine—a change in the average taste and will of merchants—one-fifth of this revenue were saved, and employed in giving additional extent to their business; then, at the next revolution of the economic cycle, instead of ten millions, we should behold ten millions and two hundred thousand

pounds vested in trade. The parsimony of one, or a few individuals, could have no noticeable effect ; but such a general parsimony would tell most sensibly on the rate of profit. The truth is, that, *all other circumstances remaining the same*, the revenue of merchants would fall, and that to the very extent in which they had enlarged their capital. For the one saving of two hundred thousand pounds, they would just lose this sum yearly in all time coming. The producing power of manufactures would be extended by this accumulation of theirs, but the returning power of consumers may remain unaltered. There would be more goods brought to market than before, but the whole price given for them may not be greater than before. Anterior to the general saving that we now imagine, capitalists, for the prime cost of ten millions, receive, in the whole price of their commodities, eleven millions. But since that saving, they, for the prime cost of ten millions two hundred thousand pounds, receive the same sum of eleven millions. By the saving in question, they have become at once richer in capital, and poorer in revenue. For the two hundred thousand pounds which they have added to the one, they have sustained a greatly overpassing loss ; for they have taken two hundred thousand, and that yearly, from the other. It might be safe and profitable for one capitalist, or a certain fractional number of them, to accumulate. But a general accumulation cannot take place, save at the expense of the general reve-

nue of capitalists. It is true, that, so long as agriculture is in progress, there might be yearly additions to the returning or replacing power, by which as large, or a larger revenue, might be afforded to a still enlarging capital. But when the progress of agriculture becomes slow and difficult, or, most of all, when it touches upon the extreme limit, then the impotency of accumulation on the part of capitalists must be severely felt. Each new investiture, in fact, will then be followed up by an adverse reaction or recoil upon themselves. As they grow in capital, they will decline in revenue. There is no escaping from this consequence, after that the returning power has become stationary. Every addition to capital, causes just a permanent yearly abstraction of the same amount from revenue; and the same return, on a larger prime cost, is all which the capitalists reap for their pains. Society obtains their enjoyments at a cheaper rate, when, by an overdone competition among capitalists, each strains at becoming richer than before. But if there be no increase in the wealth of customers, capitalists cannot persevere in such a walk of speculation, without impoverishment and ruin to many of themselves.

15. We may now see what the check is to an indefinite accumulation on the part of capitalists. If the returning power be represented by eleven millions, it is obvious that the capital vested in business cannot go beyond it. At ten millions, it would command a profit of one million to the ca-

pitalists ; and, if they chose to accumulate to a capital above this, they may successively advance it up to ten millions one hundred thousand, ten millions two hundred thousand, ten millions three hundred thousand, or ten millions four hundred thousand pounds : in which case, they would as surely reduce their collective income to nine, or eight, or seven, or six hundred thousand pounds. They might even, by the mere force of their own accumulations, bring up the capital indefinitely near to the eleven millions, but with the sure effect of bringing down this revenue indefinitely near to annihilation. Could they afford to live on nothing, they might push forward the capital to eleven millions, and annihilate profits entirely. Or if, from some other source than their accumulations, capital were still farther extended, and so as to overpass the eleven millions, profit would be converted into loss, and there would take place the absorption of a yearly excess. At the termination of the economic cycle, capital would constantly revert to eleven millions. Whatever the amount of capital may be, which, at the commencement of the economic cycle, merchants and manufacturers are able to advance, its amount, in the end, must of necessity be limited by what customers are able to return.

16. This brings into view a most important element, which hitherto has scarcely been admitted into the consideration of profit. We are abundantly familiar with the idea, that the rate of wages

is dependent on the average standard of enjoyment among labourers. But we have not been so accustomed to think of the rate of profit, as depending on the average standard of enjoyment among capitalists. Nevertheless, it is actually so. It is a question with every individual capitalist, whether he shall spend the whole revenue of the current year, or how much of it he shall reserve, for the purpose of vesting it in trade, and so giving additional extension to his business—or, finally, whether he shall expend more than his revenue, and so trench upon his capital? This question turns precisely on the balance between two appetites of his nature—between the appetite for eventual gain, and the appetite for present comfort. Should the latter prevail, *and prevail generally*, capital would be kept down, and profit be sustained. Should the former prevail, and also prevail generally, capital would be augmented, and profit be depressed. It does not affect this conclusion, that the highway to fortune, on the part of the individual merchant, is to save as much, and spend as little of his revenue as he can. It is true of every single capitalist, that he is all the richer by saving than spending; and that, under any given rate of profit, or with any given general habit on the part of capitalists. But it is not true that capitalists collectively, will become richer by saving than by spending; for, on their general habit, the rate of profit immediately and essentially depends. Could they effectuate a combination amongst themselves, they might up-

hold, at their general and collective pleasure, the rate of profit and interest in the land. But they are not able to achieve so extensive a concert, nor would its members be individually faithful in their observation of it; and this is not the only instance, in which the good of society is secured by the impossibility of combinations. Meanwhile, nothing can be truer, than that just as the wages of labour depend on the collective taste and will of labourers, so the profits of stock depend on the collective taste and will of capitalists.* With this view, profits are what capitalists in the aggregate choose to make them. And however little the rate of profit may have been associated in the minds of economists, with the standard of enjoyment in the middle classes of society—yet, ultimately and efficiently, this is precisely the element on which it turns.*

* Mr. Thomas Perronet Thomson has, with his accustomed shrewdness, noticed this connection, and thus felicitously remarks upon it.—

“ And as opinions and habits determine the final or average proportion, which shall be maintained between the numbers of the labouring population and the funds for their support, or, in other words, determine the average rate of wages, so they also determine the average rate of profits of stock, which are only the wages of another description of labourers, consisting partly of the recompense of present labour exerted in the form of superintendence, and partly of the recompense of past labour exerted in the creation of their capital. Public opinion and custom require, for example, that a shopkeeper shall have a good coat—shall drink at all times malt liquor, and sometimes wine, and give them to his neighbours, that his wife and

17. But it will demonstrate still more forcibly and clearly the limit to accumulation, if we reflect

daughters, if he has any, shall wear clean linen, and moreover not wash it themselves, and that when they travel, it shall be by the stage-coach, and not by the waggon. Though he may do without some or other of these things, in a certain degree, when necessity presses, he cannot and will not do without them in the main. If, therefore, he is a man of foresight, he will at all events defer adding to the population of shopkeepers, till he sees a fair prospect of supporting a family in the way which public opinion pronounces to be respectable. But if he engages in it without foresight, he will keep down the population of shopkeepers in another way—for he will break. Bankruptcy is the check to the indefinite multiplication of traders, as the evils arising from diminished food are the check to the indefinite multiplication of the lower classes of labourers. In the same manner, if the higher order of traders would, or could, do without a certain rate of expenditure, they might remit something of their rate of profits. If a great brewer, for example, would drive his family to the two shilling gallery in one of his own drays, or a banker be content, as in India, to sit on a mud floor in the shop of his forefathers, and retire to swallow rice with the condiment of ghee—there would be some chance of the thing being brought to pass. But the crowning city has determined, that her merchants shall be princes, and her traffickers the honourable of the earth, and they neither can, nor will resist the award. The opinion of society, therefore, is what, in the long run, determines and keeps up the rate of recompense in this class, as well as in the other; and though there may be individual exceptions, men in general will break, sooner than not live up to what is expected from them. The difficulty is not in finding men to live up to this mark, but in finding men who will live within their means. The profits of stock, like wages, may be momentarily elevated or depressed, by the fluctuations, in the proportion between the business to be done, and the men who are to do it. When

that the power of accumulating is not confined to capitalists; but that it may be, and often is, exemplified by their customers; and more especially by those who are the chief consumers of luxuries, and who have it therefore in their power to economise the use of them. We can imagine that part of our capital, which is connected with the industry of the disposable population, to amount to ten millions, being the prime cost of all the goods wrought up by this class of labourers, which enter into one revolution of the economic cycle. Should these be met by a returning power of eleven millions, the capital is fully replaced, and with a profit that enables the capitalists to live at a certain rate of

business is scarce, the competition may, to a certain degree, induce traders to do it at a cheaper rate, and the contrary. But if the scarcity of business is permanent, traders will begin to go out by the horn-gate of bankruptcy, and so the balance will be preserved"—*True Theory of Rent*, 7th Edit pp. 16, 17.

Mr. Thomson does not, perhaps, advert distinctly enough to overtrading, as a far more copious source of bankruptcy than overliving. Under a system of universal parsimony, a permanent scarcity of business relatively to the capital would ensue, and the horn-gate might be far more crowded, than under a liberal system of expenditure on the part of merchants. It is true, that the same general recklessness which leads men to overspend, might lead them to overspeculate; but it is far more to the latter, than the former habit, that our bankruptcies are owing. On the other hand, the same caution which restrains a man from spending beyond his revenue, may restrain him from trading beyond his capital—as perhaps in Holland. It is from the latter exercise of caution, greatly more than from the former, that bankruptcies are so rare in that country.

luxury and comfort. But if, after the commencement of this revolution, the holders of the returning power had been visited with the inclination to save more and spend less,—if a general retrenchment had taken place among them, so that, instead of spending eleven millions, they had laid up five, and had only assigned six millions to the purchase of those articles which had been brought to market at the expense of ten millions,—it is quite evident, that, in this instance, the original capitalists of these ten millions would find the market sadly overladen, at least, with their commodities. They had enlisted into the service of their different establishments a disposable population, whose office it is to work up luxuries for those who are enabled by their revenues to purchase them. But should a taste for luxury give place to a taste for accumulation, in the degree that we have now specified, it is obvious, that the lessening of the effective demand from eleven to six millions, must just have the effect of lessening, in this proportion, the price of their commodities. And, so far from its being in their power by parsimony, or in any other way, indefinitely to extend the capital in their hands; we find that this is not only limited by the power of their customers, but that, by a change in the will or taste of these customers, this capital could be wrested to any given extent away from them.

18. To intercept all evasions, it may be right to trace the effect of this change a little farther. The sum of five millions, that we conceive to have been

laid up by landed proprietors, is not therefore hoarded. Generally, it would be deposited in hands which lay it out in quest of gain, or on production, for the sake of a profit. We are aware of its being equally spent in either way. But, whereas formerly it wont to be spent as revenue, and with an immediate view to consumption ; now it is spent as capital, and with an immediate view to production. Let this conversion of revenue into capital be supposed to have taken place at the commencement, or along the progress, of the one economic revolution, which we suppose to have been signalled by the change in question. Then it had been possible, that, prior to the result of a market overstocked with luxuries, and the price of them falling to the level of the reduced demand, this sum of five millions might have been, imprudently or unforeseeingly, vested in the manufacture of luxuries—when, with fifteen millions expended on their preparation, and a returning power of only six millions to replace this outlay, the failure in the speculation behoved to be all the more signal. But, though this conversion of revenue into capital had not taken place till the economic cycle had fully revolved, still there would have been but a return of six millions to a cost of ten millions ; and a reduction to this extent behoved to have taken place in the capital of the original manufacturers. Or, allowing them, as before, a million a year for their maintenance, they could only begin their operations anew with a capital of five millions. So

that this conversion of revenue into capital by consumers, has not increased the capital of the country. It has only shifted it into other hands. The sum of five millions, that formerly went to be spent, is saved ; or, in other words, instead of going to replace capital in its old situation, it has gone to create capital in a new situation. The whole difference is, that, instead of being returned, it has been retained ; and, for the original capitalists in the possession of ten millions, we now behold their capital reduced to five, and the remaining five in the possession of so many customers, who, by their savings, have enriched themselves, but only to the extent in which the others have been impoverished.

19. We may pursue this hypothetical case a little further. The manufacturers of luxuries must now reduce their establishments in the proportion of the reduced demand. Should only six millions' worth of the commodities in which they deal continue to be bought, from year to year, they have still capital enough left for this extent of business. But, meanwhile, the sum of five millions, now in the hands of their old customers, waits for a profitable occupation ; and, in seeking after it, they will have been effectually warned, by the losses of their predecessors, from the manufacture of luxuries. Let us now, then, turn from this department of business, that has just rejected the excess of capital, wherewith it was overlaid, and try to imagine a settlement for the new-formed capital in some other branch of the national industry. And there

is a great, and withal a distinct department of this sort, where are prepared, not the luxuries of life for the wealthy, but the second necessaries of life for the general population. This sum will be superadded to the capital already vested in that species of industry, which we may suppose to have been previously of the amount of ten millions. It will thus be made to attain the magnitude of fifteen millions. By this change, the sum of five millions is withdrawn from the support of industry in the third class of labourers, and transferred to the support of industry in the second class. The labourers, on the whole, will have the same money, but not more, distributed among them as formerly; though a great change will be effected in the distribution of their industry—half the disposable population being taken off from the manufacture of luxuries, and passing into the secondary population, whose employment is the manufacture of second necessaries. At all events, the great customers for the second necessaries, the labourers, will not be able to make larger offers of money in the market for them than they wont; that is, if, in the purchase of second necessaries, they could only afford to pay eleven millions previous to this change, this is all the sum which they can afford still. Formerly they replaced the capital of ten millions, and afforded an additional million in profit for the livelihood of the capitalists. They would now fall short of replacing the capital of fifteen millions, embarked in the preparation of second necessaries,

by the sum of four millions. The capitalists who dealt in second necessities, allowing them one million to live upon, would only be able to start, as before, with ten millions, and that notwithstanding the investiture of an additional five millions at the commencement of the last economic cycle in their business. Such a yearly investiture, in fact, all other circumstances remaining the same, would be followed up by a regular yearly extinction of the sum invested. There would of course, so long as it continued, be an unnatural cheapness of the second necessities. Let the wealthy stint themselves to one-half of their usual luxuries, and then vest the produce of their economy in the manufacture of second necessities, and this were tantamount to a gratuitous distribution, to that extent, of additional second necessities among the general population. The additional investiture of five millions, calling forth no additional return from the purchasers, is, in effect, equivalent to a gift of five millions' worth shared among them. It is not necessary to strengthen our argument, by supposing the taste for accumulation to extend also among the common people. They would certainly be enabled to indulge this taste, by the cheapness of all the second necessities, and might, if they so chose, spend less than their wonted sum on the purchase, and yet be as well clothed and lodged as formerly. This, as far as it went, would reduce their return for the fifteen millions, to a less sum than the eleven millions, and serve to enhance still more the proof

of an utter powerlessness on the part of indefinite parsimony to create or to sustain an indefinitely increasing capital.

20. As capital, then, would not continue to rush into a business where the goods, from the excess and superfluity of their production, sold for less than prime cost, we may now, with all safety, conclude, that the five millions annually saved by the landed proprietors, and which had been rejected from the manufacture of luxuries, would be equally rejected from the manufacture of second necessities. And should the saving continue to be made, there only remains another great department on which to try the investiture of this sum. After having sought in vain for the profitable occupation of itself in the business of the disposable and secondary classes, we may now suppose, for a moment, that it has found a landing-place in agriculture. In this case, half the disposable population, withdrawn from their old employment, would be turned to the new employment of cultivating the land—spreading tillage over a greater extent than before among soils which had been yet unbroken, and carrying it to a greater depth and perfection than before, in the soils that had previously been entered on. It should be recollected that, previous to this accumulation and its investiture, the agriculture had been already carried forward to that limit which has so often met our notice; and from the contemplation we may again draw an important lesson—even that there is a like limit to the extension of

capital. But, before adverting to this limit, we would remark, in the first instance, that, if the agricultural capital, previously to this new investiture, was ten millions, it now becomes fifteen millions. And as there is nothing in this change which can immediately, and at once, furnish the general population with a greater returning power than before, there would only, for one year at least, be a return of ten millions for the now extended investiture of fifteen millions. We believe, that, in this department of business, the loss would be greatly aggravated by the circumstance of the great increase that must at first take place in the food of the country, without an instant corresponding increase of population. This would cheapen the article much beneath the rate at which luxuries or second necessities would be cheapened, from the same cause of an excess in their production. One can indefinitely extend his use of luxuries, or his use of second necessities, but he cannot indefinitely extend his use of the first necessities of life. One can treat himself with double the amount of splendid furniture, or use double the amount of clothes, but he cannot eat double the quantity of bread that he wont. It is thus that an excess of food causes a much greater depression of its price, than a like excess of most other articles; so that the return for the fifteen millions of capital, now embarked in agriculture, would, we are persuaded, be greatly less than the eleven millions, formerly returned for the ten millions that wont to be embarked in it.

This will always form a strong initial barrier in the way of vesting more capital in agriculture, than what the state of the country at the time admitted of. No distant anticipations could tempt capitalists very far in this walk of speculation, with such a grievous absorption to meet them at the outset, or could tempt men by their savings to become capitalists.

21. But although there were no fall of price from the extension of agriculture beyond its natural limit, there is a sufficient barrier to this extension in the unproductiveness of the land which lies beyond it. The agriculture stops where it does, just because the land of last quality is barely sufficient to repay the expenses of its husbandry; and, in the existing state of agricultural labour and machinery, no land beneath this could be attempted without loss to the cultivator. We might conceive of the next land beneath, that its produce fell short, by one-tenth, of the ability to feed its agricultural labourers and their secondaries; or, that it would require a hundred, made up from both these classes, to raise food for ninety labourers. This would obviously increase the whole means of subsistence in the country. By this single instance, there would be food for ninety labourers added to the whole previous amount of the national produce, although it did require the work of a hundred labourers to raise it. Were this instance multiplied into an extensive system of home-colonization, there is no doubt that, in the first instance, there would be a sen-

sible increase of the chief necessities of life, and a temporary cheapening thereof, to the sensible relief of all the labouring classes in the land. But the increase of population would speedily restore the old price, when we should behold a larger, but not a more comfortable peasantry than before; and the last land, now that the natural limit of cultivation had been forced, only yielding the food of ninety labourers in return for the work of a hundred. It may be asked, whence are the ten labourers obtained? The husbandry of these inferior soils, not being able to repay itself, must be maintained, either by the voluntary benevolence of individuals, or by taxation. In either way there is a sacrifice of luxury on the part of the wealthier classes; or, in other words, so many labourers are withdrawn by this operation from the disposable, and placed in the agricultural or secondary classes. The process by which food has been raised for an additional hundred, has had the effect of at least withdrawing ten from the disposable population. It may be extended to land of the next inferior quality; where, for every additional hundred that can be fed by its produce, twenty must be withdrawn from the disposable population. This may be conceived to go downward, till rent is annihilated, or the last man is withdrawn from a disposable population, now upheld by the landed proprietors. So that home-colonization, the moment it passes beneath the limit of that land which yields a profit to the cultivator, may be regarded as having entered on the

first step of a process, that, if consummated, would give us a larger population certainly, but a population almost wholly made up of the secondary and agrarian classes; and, therefore, labouring for the supply of a now larger society in the mere necessities of existence. Meanwhile, the disposable population must have waned toward its extinction. The community will have gained in numbers, but not in comfort, even to the general mass of families. And it will have lost the services which are rendered by the disposable class—a forfeiture this, not merely of the elegancies of life to the wealthier classes, but the far heavier forfeiture of all that can civilize the species, or subserve the purest and highest objects of patriotism.*

22. But, without here pursuing this speculation so far, we may clearly see how, even at the outset of such a process, there is a limit to the profitable embarkation of additional capital on agriculture. The land which cannot even feed its direct and secondary labourers, will far less yield a remuneration to the capital which landlords may have saved from their revenue; and which, rejected from two of the great branches of national industry, is vainly endeavouring to find a profitable investment for itself in the greatest and most important of all—the agricultural department. The domain of cultivation is, no doubt, gradually widening with the improvements that are ever taking place

* See Appendix, C.—On Home-Colonization.

in the methods of agricultural labour. But when capital makes a rash attempt beyond this boundary, it is sure to be absorbed. While landed property continues, and the owners have a free control over their own movements, this cannot long be submitted to. The landlord will not continue to employ, on a land that brings no return, agricultural labourers, who might, for the sum he is yearly spending in the shape of unproductive capital, be serving him in the capacity of disposable labourers; and from whose hands he might obtain a substantial return of comfort for the same sum, when expended in the shape of revenue. Neither will the tenant persist in cultivating land which yields him no profit. There is no escaping from the conclusion. Accumulation, or the conversion of revenue into capital, has its limits in this as well as in every other division of the business of society. In other words, capital is hemmed on all sides by a slowly-receding boundary, which it cannot overpass; and beyond which, if it attempt to enlarge itself, it is broken into surges at the barrier by which it is surrounded.*

* We may here remark, how extraordinary it is, that the doctrine of the impossibility of a general glut—or, which comes to the same thing, the doctrine, that capital might find indefinite room for its own profitable investiture—should have been strenuously advocated by the disciples of a school, which connects the rate of profit with the return that is yielded to the husbandman by the last cultivated land. It is sufficient, to establish our view of the question, that the land which can afford a rent is of finite quantity, and requires but a finite capi-

CHAPTER IV.

ON THE PARALLEL BETWEEN POPULATION AND CAPITAL, BOTH IN RESPECT OF THEIR LIMITS AND THEIR POWERS OF EXPANSION.

1. WE have now abundantly shown, how impossible it is to sustain or accumulate capital beyond what a country can bear in the existing state of its agriculture; though, when the agriculture itself extends, every thing else extends along with it. The larger population, consequent on the increase of agricultural produce, demands a larger supply of the second necessities, and the manufacture of these requires additional hands, and the investiture of new capital. The increase of rent, consequent

tal for the full occupation of it. Let the capital then exceed this, and flow over on soils of inferior fertility, and you will soon reach an agriculture, the produce of which cannot even feed the direct and secondary labourers. This affords a clear example of a return falling short of the outlay,—the food produced falling short of the food expended. Now, on the principle, and it is a just one, that the profit on all other business is commensurate with that on agriculture, we shall, in such a state of things, from the general exuberance of capital, have profit converted into loss, or what may be termed a negative profit, repressing this exuberance throughout all the departments of enterprise, and so keeping down the capital to what the country can bear.

on the descent among inferior soils, gives to landlords a larger command over the luxuries of life than before ; and hence, a greater disposable population, with room also for the employment of additional capital in this branch of the nation's industry. Only let the agriculture be such that the population may be comfortably fed ; and there is no fear of a right distribution for them,—falling in as they will, among the agricultural, the secondary, or the disposable classes, just according to circumstances. And there is as little fear of the labourers, in all the three, being rightly proportioned between the immediate and the antecedent.* Too many labourers, on the whole, would argue an excess of population ; and too large a proportion of antecedent labourers, would just as certainly argue an excess of capital. The one excess is limited by the impossibility of labourers being subsisted beneath a certain rate of wages ; and the other excess, as effectually limited by the impossibility of capital being supported beneath a certain rate of profit. Historically, both undergo an increase—but just as the increasing agriculture lets them. Population wont force agriculture beyond a certain limit ; but agriculture will ever draw population after it. And the same may be as truly affirmed of capital. It wont force agriculture beyond a certain limit,—and should it, in the moment of its redundancy, seek to do so, it will be sunk or dissipated.

* See Chap. III. Sect. 9.

pated, and so its excess lopped off. There is a prevalent mistake respecting the order of causation, or the order of antecedency in this matter. It is not an uncommon imagination, that let capital be only accumulated to any extent; and to that extent it will, without let or obstruction, speed on the agriculture. It were far more correct to say, that agriculture opens room for the occupancy of capital.

2. We are not blind to the circumstance, that population, through its excess, and the consequent lowering of wages, opens a way into inferior soils, which, under a higher wage, could not have been entered on—not to the circumstance that capital, through its excess, and the consequent lowering of profits, causes a similar descent, and so an extension of the agriculture. Even such may be the redundancy of the former, that, in a general distress for provisions, land may be attempted, from which but a miserable subsistence can be wrested; and such may be the redundancy of the latter, that, in the general difficulty for a profitable investment, land may be attempted, which, instead of sustaining and extending, extinguishes the capital that is put upon it. In this view, both population and capital may be regarded as impellent causes, for hastening forward the progress of agriculture. Yet it is not the object of a wise policy, to stimulate, beyond the natural incitements to their progress, the increase of either. Grant but a state of security and social order—and the spontaneous

tendency, whether of population or of capital, is to increase with a rapidity far beyond the movement of that slowly-receding barrier which, ever and anon, is checking the precipitation, and repressing the increase of both. And better, we think, than that either should be urged forward against this barrier, by the inconvenience of a painful excess—better if the secret could be discovered, by which both might be taught to moderate their pace, and to walk in pacific and prosperous advancement, side by side with the natural enlargement of agriculture; that capital, as well as labour, might be saved from those visitations of distress, which are sure to come on both, when alike straitened and overborne, each by the weight of its own undue accumulation.

3. There is a parallel between population and capital, which, if more dwelt upon, would rectify the sanguine and extravagant imaginations, that are still afloat respecting the power and indefinite capabilities of the latter; seeing they are the very imaginations which at one time prevailed regarding the former. The days once were, when population was the great demand of patriots and political economists; and accordingly, it was held the wisest policy of a state, to encourage early marriages, and raise foundling hospitals, and artificially foster in every sort of way this one element of national greatness. The days still are, when capital is the great demand of politicians and philanthropists; and it is imagined, that by every effort of

parsimony, by retrenchment in all directions, whether public or private, by accumulation to the uttermost, we may build up to an indefinite extent, this other element of national greatness. The limits of the first are now understood; and also its own spontaneous tendency to overpass these limits, so as to supersaturate a country, and produce distress among families. The limits of the second are not understood; neither is it seen, how, instead of being the object of an anxious or watchful solicitude on the part of statesmen, it may safely be left to the operation of those natural principles, in virtue of which it is ever tending to its own redundancy, and working by its very excess the infliction of many a heavy misfortune on the capitalists of the land. In this respect there is no difference between immediate and antecedent labour. The one is liable to as great excess as the other. As too many human hands may be working *now*, and drawing in return an inadequate subsistence; so too many human hands may have been working *last year*, and the existent products of their industry, whether in the shape of goods, or instruments of future production, may be drawing a return of gains that are wholly as inadequate. What the action of low wages is upon population, so the action of low profit is upon capital. They prevent the increase of both beyond a certain amount. Nay, support in the one case may decline into starvation; and population be lessened in consequence,—and profit, in the other case, may

be turned into loss, and capital be effectually lessened also.

4. But population and capital not only resemble each other, in respect of the limit which opposes their indefinite augmentation. They are both subject to losses and deficiencies beneath this limit, and they resemble each other in respect of the exceeding force and facility wherewith these deficiencies are repaired. If, by the operation of disease or war, any sudden and large blank have been made in the population, it is now understood how speedily this vacuum is filled again, by the general translation of the families into better circumstances, and the stimulus given from this cause to a number of marriages that would have otherwise been postponed. And, accordingly, an unwonted number of deaths in one year is followed up, as may be seen from the tables of political arithmetic, by a like unwonted number of births, throughout the short period of a few years thereafter. But it is not adverted to, that the deficiencies of capital are repaired by a process still more sudden. Let the whole capital embarked in glass-making, for example, be a million of money, which, if replaced in one revolution of the economic cycle by eleven hundred thousand pounds, would enable the manufacturers to live, and to commence their course anew, in the same circumstances as before. But we may conceive one of these manufacturers, with the capital of a hundred thousand, to have withdrawn it from business, and to have squandered

it in a fit of extravagance, so that, in a few months, there is not a vestige of his fortune remaining. The common imagination is, that the capital thus wasted by the dissipation of one capitalist, can only be repaired by a strenuous parsimony on the part of all the rest. But the truth is, it may be repaired, and that in the course of a single twelve-month, from another cause. There is nothing, generally speaking, in the extravagance of this said glass-maker, that can affect the wealth or ability of his customers. It may lessen, for one year at least, the quantity prepared, but it lessens not the ability to purchase. If eleven hundred thousand pounds were in readiness last year, for buying up the glass that had been manufactured at the expense of a million, there is nothing, in the wasteful expenditure of one of the capitalists, that can prevent the same sum of eleven hundred thousand pounds from being in readiness next year. The producing power is, for one season, impaired; but the returning power is as great as ever. And the effect is just a rise in the price of the article. When the effective demand is the same as before, the price, averagely speaking, is in the inverse proportion of the quantity brought to market. The price of eleven hundred thousand pounds, given last year in return for the cost of a million, is given this year in return for the cost of nine hundred thousand. The capital is thus restored to its original magnitude; and that, without any effort or hard straining on the part of the remaining capitalists.

The truth is, that to them it has been a prosperous, a holiday season of high prices and flourishing markets. That extravagance which has ruined their brother capitalists, has enriched them. They, in a single year, have fallen both into his profits and his capital. So far from being more pains-taking, or penuriously economical than before, they might spend among them the ten thousand pounds which came to him in the shape of revenue, and still inherit the whole of his capital, or the hundred thousand pounds into the bargain. The glass-making capital is fully replaced, not with any sacrifice or self-denial on their part, but at the expense of their customers—and with the temporary mischief to these, of a tenth less of the article of glass than they would otherwise have had, the capital starts again into as great extent and efficiency as before.*

5. It is thus that, in capital, there is a restorative virtue, which, as if by the instant force of elasticity, causes it, speedily and spontaneously, to recover the encroachments that have been made upon it.

* Or the capital may be repaired not at the expense of the customers, but at the expense of the manufacturing labourers, who, if they all keep by their wonted employment, must be satisfied for one year with a proportional reduction of their wages. In this way the usual quantity of glass may be supplied at the usual price, but with such a profit from the diminished outlay, as to make up the deficiency which had been created in the capital of glass-makers. This subject is treated at greater length in my work on the Christian and Civic Economy of Large Towns, Vol. III p 308, *et seq*

Grant but a secure administration of justice, and a well-regulated social economy, and as certainly as the population of a country follows hard upon its food, so certainly does the capital follow hard upon all that business which, in the existing state of things, it is profitable or possible to carry on in it. If in excess, then it over-produces; and, through the medium of consequent low prices, the excess is lopped off in one revolution of the economic cycle. If in defect, then it under-produces; and, through the medium of consequent high prices, the deficiency is repaired in one revolution of the economic cycle. It is thus that, from year to year, the capital may oscillate on each side of the returning power; but the latter is the place to which the former is constantly, though tremulously tending; nor will the vibrations ever go far, or for a great length of time, in either way. The capital, ever adjusting itself to the likely returns, is just the supply ever adjusting itself to the effective demand. And whether that demand be for immediate labour, or for the products of antecedent labour, it will, according to its relative magnitude, act at one time as a check, and at another as an encouragement, on population, or on capital, or on both.

6. The general effect of the reasoning in Dr. Smith's *Wealth of Nations*, (and that notwithstanding his occasional recognitions of the truth,) is to impress the idea, that by accumulation a country makes unceasing advances, and without any let or hindrance, *ab extra*, in wealth and economic pros-

perity. It is not mere hoarding that he recommends, but the accumulation of productive capital, or of capital turned to use, and going forth in repeated outlays on the business of production. But to uphold the capital, these outlays must be replaced, which they can only be by the expenditure of those who consume. Mr. Malthus, on this, institutes a question respecting the balance between production and expenditure; arguing rightly, that if it was to be no expenditure, the motive to production would cease, and if it was to be all expenditure, the materials and instruments of production would be destroyed.* There must, then, be a line

* “ Adam Smith has stated, that capitals are increased by parsimony, that every frugal man is a public benefactor, and that the increase of wealth depends on the balance of produce above consumption. That these propositions are true to a great extent, is perfectly unquestionable. No considerable and continued increase of wealth could possibly take place without that degree of frugality which occasions, annually, the conversion of some revenue into capital, and creates a balance of produce above consumption, but it is quite obvious that they are not true to an indefinite extent, and that the principle of saving, pushed to excess, would destroy the motive to production. If every person were satisfied with the simplest food, the poorest clothing, and the meanest houses, it is certain that no other sort of food, clothing, and lodging, would be in existence, and as there would be no adequate motive to the proprietors of land to cultivate well, not only the wealth derived from conveniences and luxuries would be quite at an end, but if the same divisions of land continued, the production of food would be prematurely checked, and population would come to a stand, long before the soil had been well cultivated. If consumption exceed production, the capital of the country must be dimi-

somewhere between production and expenditure, which it were best, on the whole, for a country to observe; but whether it be possible verbally to describe that line or not, practically nature hath, as in the case of population and food, provided both checks and stimulants, in virtue of which the economic machine might, with all safety, be left to its own movements. There is, on the one hand, an appetite for future wealth, and, on the other, an appetite for present indulgence. If either were to take possession of the country, in the shape of a universal mania, it might overturn the balance of society. But just in proportion as either of these forces goes to excess, and so causes a deviation from the line of optimism on one side, in that proportion is the other, or counteractive force, augmented, so as at length to recal the stray movement, and cause an oscillation towards the other side. Should accumulation go to excess, and so the supply in markets overpass the demand, the lowering of profits will check the farther tendency, and the wealthy feel tempted to purchase present

nished, and its wealth must be gradually destroyed, from its want of power to produce, if production be in a great excess above consumption, the motive to accumulate and produce must cease, from the want of will to consume. The two extremes are obvious, and it follows, that there must be some intermediate point, though the resources of political economy may not be able to ascertain it, where, taking into consideration both the power to produce, and the will to consume, the encouragement to the increase of wealth is the greatest."—*Malthus' Political Economy*, pages 8, 9.

enjoyment with the overflowings of their revenue, rather than throw them away on unproductive investments. Should expenditure go to excess, and so the demand in markets overpass the supply, the rise of prices will not only prove a check to farther expenditure, but will tempt the cupidity of capitalists to every possible accumulation, that they may multiply and spread out their investments to the uttermost, and so catch, each for himself, as large a share of the current prosperity as he may. It is thus that there are restraining forces in operation, which prevent the extremes either of accumulation or of expenditure from being predominant in the land. The capital never goes to such excess as to annihilate all profit, or that fraction of it—the interest of money. And the expenditure never goes to such excess, as to sweep off capital from any branch of industry where it can be safely or lucratively employed.

7. But instead of one universal mania on the side either of expenditure or accumulation, the former appetite may be in excess with a certain number of individuals in the community, and the latter appetite be in excess with a certain and distinct number of other individuals. This represents the actual state of society, and it may be right to consider for a moment the effect of it. It will be found that expenditure, though in great excess, and that too amongst a great number of people, may not, after all, operate to the extinction, or even to a stay on the proper increase of capital. The truth

is, that the love of indulgence in one quarter of society, will ever be sufficiently met by the love of acquisition in another quarter of society, to keep up the capital of the country in an abundantly effective state for producing all, which capitalists find it their advantage and their interest to produce. We can imagine each appetite carried so far, as that one set of men shall spend in extravagance more than their income, and another set of men shall lay out in business more than their capital. Let us begin with the first supposition; and it might make the effect more palpable, to make use in illustration of large numbers, nor will it affect the validity of our conclusion, though the numbers should be greater than are ever realized. We shall state the income of all our landed proprietors at one hundred millions, and conceive that, in virtue of an extravagant habit amongst them, their whole expenditure is one hundred and ten millions. It matters not to the argument, whether they are enabled to spend this excess of ten millions, by means of a credit directly afforded to them of the dealers from whom they buy, or of a credit afforded to them from men in whose written engagements the country has faith, and whose notes, therefore, have the power which belongs to money, of lifting the commodities for which it is offered in exchange. In either way, ten millions more have been offered, and ten millions more have been received, for the various articles of enjoyment and expense that have been brought to market throughout the year,

than otherwise would have been, but for this wasteful extravagance on the part of the landlords. Had new purchasers to the amount of ten millions started up, this addition to the demand would just have raised the money price of all these articles; but not more than does this extended demand of old purchasers. The effect of extravagance, on the part of old customers, is just to raise prices as much, as if the additional purchases had all been made by new customers. There is no waste of productive capital incurred by this extravagance on the part of landlords. Capitalists may have been carrying on their operations, through one year of this extravagance, in the very same way; and of consequence brought the same quantity of finished goods to market, as if landlords had been spending their incomes only, and no more. And the whole effect of their spending more, is just to raise the price of these goods. If they bring a pecuniary demand to the market, of ten millions more than they ought to have done; this raises prices, and accordingly profits, to the extent of ten millions more than they otherwise would have been. Extravagance does not immediately and of itself increase the quantity of goods brought to market. The individuals who are extravagant, engross a larger quantity of these goods for the year, than would else have come to their share. But they are indulging their love of pleasure at the expense of their own fortune, and also at the expense of the general enjoyment of all other consumers who may keep within their incomes, and have the dis-

advantage of greater prices, and, consequently, a less amount of enjoyment than they would have had, but for the wasteful expenditure of so many of their fellows. This extravagance for a year leaves the supply unaltered, but, by increasing the demand, raises for that year the price of all the articles on which so much of additional expenditure has been lavished. Landlords have been impoverished to the extent of ten millions by this extravagance; but to that very extent, through the augmentation of price or profit, have capitalists been enriched by them. As much as they have mortgaged their estates, and thereby reduced their own wealth, so much have they transferred of a lifting power that enables others to purchase land to the whole value of the mortgage. The extravagance of landlords does not have all the effect which is ascribed to it, in the way of reducing the property of the nation. Mainly, its effect is but to transfer the property of the nation. In as far as it keeps up prices and profit, it retards the progress of cultivation among new soils. And so long also as an estate is in the possession of a dissipated proprietor, this may be a temporary let in the way of its improvement. Yet, bating these exceptions, the extravagance of landlords does not produce a *reduction* in the property of the nation, but only a *rotation* of it.*

•

* By its effect on prices, this ultra expenditure of landlords lessens the share of the annual supply, which would otherwise have fallen to all other customers.

8. And the effect of overspending on the part of consumers, to raise prices, is neutralized by the effect of overtrading on the part of capitalists, to lower prices. These two opposite vices may prevail to a great extent in society, and that too from their counteraction of each other, without sensibly impairing the capital, or altering the rate of profit. As there may be an extravagant love of pleasure, leading one man to lay out on present indulgence more than his revenue; so there may be an excessive love of gain, leading another man to excessive speculation, or to lay out, on business, more than his capital. He is enabled to do this by the trust reposed in him, either on the part of those from whom he purchases the various materials of his speculation, or on the part of lenders, who accommodate him with money, or with written engagements, which have the virtue that belongs to money. At all events, if he purchase more than he ought, to that extent he raises the price of the things purchased, and so the cost of the articles which he manufactures, or of the articles in which he deals. But he furthermore pours a larger supply of these articles into market, and so far reduces their selling price. For every new adventurer, who enters any walk of commercial enterprise, or for every old capitalist, who has already entered it, and become more adventurous than before, the cost of the commodity is proportionally raised, and its price proportionally lowered. This soon meets with its corrective in bankruptcies and losing spe-

culations, by which some are driven from the trade altogether, and only those whose fortunes are reduced, but not annihilated, can keep possession of the field.*

9. In the matter of population, and consequently of wages, there may be a balance between the improvidence of many individuals on the one hand, who rush precipitately into marriage, and the licentious celibacy of many on the other hand, who, though entitled by the sufficiency of their circumstances to enter upon this state, prefer a life of dissipation. The one excess may so neutralize the other, as to produce betwixt them no aggregate

* The problem suggested by Mr Malthus, in the passage which we have extracted at sect. 6. of this chapter, meets with its readiest solution, by connecting it with the influence which an increase of production on the one hand, or of consumption on the other, has on cultivation. The more that production prevails over consumption, as in peaceable, and industrious, and well-regulated communities, the more do prices, and therefore profits fall, so as to carry down the cultivation among poorer soils, and by enlarging the agricultural produce, or the maintenance of labour, to make the country richer in all the products of labour. This will meet with its effectual check, when this superiority of production over consumption, with its effect on profit, is carried so far, that the last returns, whether from agriculture or any other business, do not yield what has been called a living profit. On the other hand, in those countries where the consumption or expenditure bears a greater proportion to the production, as in demi-barbarous, and unsettled, and oppressed communities, where profit and the interest of money are high, the cultivation is proportionally contracted, and wealth, as being mainly dependent on the amount of agricultural produce, is contracted along with it

effect upon the population ; but better, certainly, that neither excess obtained, and that the same result were brought about, by the avoidance alike of profligacy, and of premature marriages. So in the matter of capital, and consequently of profits, there may be a balance between the extravagance of many individuals on the one hand, and the reckless temerity of many commercial speculatists on the other. And the one excess may so neutralize the other, as to produce betwixt them no aggregate effect upon profit. But better too, in this instance, that neither the one excess nor the other did obtain ; that no man spent beyond his income, and no man speculated beyond the fair and honest likelihoods of the business he was engaged with. It may cause no sensible difference to the two great public and economic interests of profit and wages ; but there is involved in it a momentous difference to the worth of individual character, and the comfort of families. We feel no dread anticipation of national loss, either from profuse expenditure or from excessive speculation. But both habits are much to be deprecated, as being alike unfavourable to private virtue and happiness. And both these excesses may in fact be realized by the same individual—in whom the appetite for gain, and the appetite for indulgence, may meet together in hurtful and vicious combination. This we often find exemplified in the present age ; when splendid extravagance is followed by splendid bankruptcy, out of the wrecks and ashes of which there sud-

denly ariseth a phoenix as splendid as before. But we deem that all the liberalities of such an age, form no equivalent for those virtues of more severe and unbending aspect, which flourished in other days; when the good old temperament of hard and honest, sat more conspicuously than they do now on the visage of plodding and painstaking, but withal well-conditioned and well-principled citizens; and when, sturdy and well-built in all the cardinal virtues, the grandfathers of our present race, with their homely fair and their primitive habits, were still uninfected by the vice and vanity of modern times. This we deem to have been better and wholesomer far, than is a commerce of proud and precarious adventure; and we do indeed hold the passions, and the profligacies, and the gaming artifices of her now deeper play, to be wretchedly atoned for, by all the gaudy efflorescence of her pageant style, and her mushroom palaces.

10. We may with all safety conclude then, that, under the protection of equitable law, capital is sure to maintain itself fully up to the state at which it is most beneficial; and even tends to go beyond this. When reduced by any cause beneath this standard, it evinces the same restorative force as that which belongs to the element of population. The increase of the one need be no more the subject of demand or anxiety, than that of the other. The expenditure in excess of mere customers, as of landed proprietors, does not lessen capital. It but

raises money prices, and so the very extravagance which mortgages the land to the extent of ten millions, transfers the power of purchasing, to that extent, to some other quarter in society, and thus occasions a mere change or division in property, without a diminution of it. The expenditure of capitalists themselves may lessen capital, but the operation of a high profit almost instantly recovers it, just as when disease or war lessens population, the operation of a high wage is to act as a stimulus to marriage; and so bring, in a little time, the number of the people up to the means of their subsistence. There is no artificial fostering requisite for the upholding of either. Each may with all safety be left to itself, and the danger is as small, that we shall not have enough of antecedent, as that we shall not have enough of immediate labour. The less of population to the food, the more is there of plenty among labourers. The less of capital to the business, the more is there of profit among capitalists. But neither will the food remain long in excess, nor the profit in excess. With both there is a rapid tendency to excess the other way; that is, to an excess of population on the one hand, and an excess of capital on the other. It is not by the deficiency of these, but by the redundancy of these, that distress and inconvenience begin to be felt, first, among the labourers, secondly, among their employers. There is no need for exciting, beyond the operation of its own spontaneous forces, an increase of the supply of immediate labour; for, in

truth, it is the over-supply of this, that, by the lowering of wages, spreads discomfort among the people. And there is just as little need for exciting, beyond the operation of its own spontaneous forces, an increase of the supply of antecedent labour; for it is the over-supply of this, which, by the lowering, or the destruction of profits, turns merchandise into a desperate game, and spreads disorder among capitalists.

11. We hear much from the economists of ruinous extravagance. Now, individual landlords, and individual capitalists, will find it ruinous to themselves; but it is only because the extravagance of the former causes a rotation of wealth, by which it is moved away from them, and because the extravagance of the latter causes first a destruction, and then an almost instant replacement of wealth, which springs up in other hands. Meanwhile, and notwithstanding the play of these yearly oscillations, the property and capital of the nation abide in unimpaired magnitude. But the general fancy is, that if there have been a defalcation of capital, through the extravagance of some, it is repaired through the parsimony and painful accumulation of others. Instead of which, it is repaired, and that almost *per saltum*, not by means of parsimony on the part of capitalists, but by means of high prices for a year, which is tantamount, we admit, to a privation for that time on the part of customers. Never are capitalists more exempted from the duties and the cares of frugality, than when

this restorative process is going on ; for to them it is a season of hey-day prosperity, wherein, without any change of habit, or rather, notwithstanding an increase, if they so choose, of expenditure and luxury, the capital, wasted or withdrawn from business by others, comes back, with almost instant reflux, upon themselves. They, without effort, fall into possession of the ground which the others had abandoned, and find it as full of capital, and as productive of revenue, as before. It is all an enlargement to them ; and at no time was this more apparent, than when the borrowing system, by government, was in full activity ; producing, therefore, a yearly extinction of capital, and yet closely followed up by its yearly regeneration. It was not regenerated, as Dr. Smith imagines, by parsimony, but by a rise of profits. The twenty millions, borrowed one year, and withdrawn from the business of production, just by the inverse action of supply upon prices, were replaced next year, to the great and sudden enrichment of all the monied and mercantile interests in the land. And the same loan to government, if repeated for ten years, would just be followed by the same effect ; that is, a season of this duration distinguished by its high prices, and so by its high profits. The reality of this process stands palpably forth to observation in the price of stocks—which fall in war sometimes to half of their value in peace ; and indicating, therefore, no less than a double rate of profit. This will suffice to account for the full maintenance of the capital

of a nation, notwithstanding the repeated drafts on that capital by borrowing. The lenders withdraw their fortunes from business, and virtually become mortgagees upon the land; having their interest paid by a perpetual tax, that falls upon the country, and we think upon the landlords. The capitals which remain in trade are then suddenly enlarged, by the impulse given to profits. The perfect sufficiency of this capital for the business of the nation, even under all the encroachments to which it is subjected by government loans, is abundantly obvious; and is ascribed, by Dr. Smith, to the compensation by the savings in one class of the community for the squanderings of another. But the true explanation is, that it arises from the high prices to which the community at large are subjected; it being, in truth, a season of privation to them, while a season of feverish prosperity to manufacturers and merchants. And, meanwhile, the expenditure does not diminish the property of the nation; it only transfers a part, and so divides it. The land is as good as partitioned between the landed proprietors and the national creditors, who are the mortgagees. Should the debt overtake the wealth of our proprietors—should the mortgage equal the value of the land, and still justice be scrupulously adhered to, there would be no disappearance of property in consequence; there would only be the dispossession of existing proprietors. Landlords would have to do generally, in consequence of the extravagance of government, what

they have often to do severally, in consequence of their own individual extravagance. They would have to renounce their estates in favour of their creditors; when, as we have already said, the ultimate effect of the expenditure would be found, not in the main to have been a reduction of property, but only a rotation of it.

12. Dr. Smith mourns over our national debt, as if, by each successive act of its extension, the country had been thrown permanently back in the career of economic prosperity. It has been computed by some, how much more populous we should have been, had the practice of inoculation been discovered sooner; and, in like manner, he computes how much richer we should have been, had the different sums borrowed by government been all retained as capital. But the truth is, that it never could have stood as capital. The effect of the debt, while under its process of formation, was to subject the people to higher prices, and so to a scantier supply of all the comforts of life. Had there been no formation of a debt, and the people been left to their wonted supply of these articles, they would just have made all the larger use of them; and if not, there would have been an excess of capital beyond what the country could bear, and so an absorption of this excess, in the losses and the bankruptcies of over-trading. The whole effect of the debt at the time of its contraction, is to expose the people to those higher prices, which have both to return the abiding, and to replace the

withdrawn capital. And the whole effect of the debt afterwards, is to divide property, just as a mortgage divides it between the creditor and the landed proprietor. We look to the wrong quarter for its effect, when we look for a diminished capital. We are aware, that for a time it may keep back the cultivation of the land, by the temporary elevation which it imparts to profit; but even this is speedily recovered, when the borrowing system ceases, and profit falls again. The truth is, that while this borrowing system lasted, capital was upheld in full extent and sufficiency; and when the borrowing system terminated, capital, unprovided with its wonted vent or absorbent, went to dissipation, in the overflow of its own exuberance. It was felt to be a paradox at the time; but we think it admits of lucid explanation, that capitalists flourished in war, and that in peace they suffered the reaction of many adversities and losses.*

13. It is readily enough perceived, how soon the population of a country recovers from the effects of a desolating war; and how, with its agriculture and its seasons unchanged, it witnesses, in a few years, an equal number of equally thriving families. But there is just as great vigour and indestructibility in the element of capital; which, though wrecked to the uttermost by victorious armies, will, in the course of a few years, attain to all the magnitude, and all the efficiency, which it ever had. If,

* See Appendix, D.—On the National Debt.

by the multiplication of labourers, the country will soon have enough of population ; then, simply by a right distribution of them into the immediate and antecedent, the country will almost as soon have enough of capital. And this distribution may, with all safety, be left to the guidance of individual interest. The first effect of the lessened capital would be a lessened production , and in repairing this, the chief and foremost effects would, of course, be directed to those things that were of most urgent necessity. Hence a greater than ordinary proportion of the people would be set to repair the deficiency of food, who, between, their immediate and antecedent labour, would speedily put the fields into their wonted order, and give their wonted completeness to the instruments of husbandry. After this had been achieved, the great and extraordinary effort would then be transferred to the manufacture of second necessaries ; for that would now be the quarter of greatest demand, and at the same time deficiency ; and where, therefore, under the encouragement of highest price, capital would be most readily allured, or rather, most quickly forced up to its original magnitude. And so this matter would proceed, till, in a very few years, the recovery both of population and of capital would be completed. By one revolution of the economic cycle, what is termed *the circulating capital* would be nearly restored ; and by a few revolutions more, what is termed the *fixed capital* would be fully restored, and all this, not by the parsimony of suc-

cessive generations, but by the privations of a very few successive seasons. It has been a theme of wonder to historians, that, after the most sanguinary and destructive wars, a country should so fast emerge again into its wonted prosperity and strength. Like the mysterious sanative principle in the human body, it has had a mysterious appellation given to it, and been ascribed to an unknown *vis medicatrix* in the body politic. But such a disguise for ignorance is altogether unneeded; for there is no mystery whatever in the process. It is all due to the action of forces perfectly understood, however little applied to the explanation of the phenomena in question. The effect of a high profit on a deficient capital, may be just as lucidly apprehended as the effect of a high wage on a deficient population. They, in a very short time, cease to be deficient. The facts of history upon this subject are notoriously in accordance with the principles of science; nor should we any longer marvel, why Russia, and Prussia, and Austria, and France, after having, to all appearance, exhausted each other, should, in less than half a generation, be able to renew their conflicts in as great force and fulness as before.

14. It is in old and well-governed countries where capital is most exposed to the discomfiture of its attempts for its own enlargement. It is in these where profit has sunk to the lowest state that is consistent with the maintenance of capital; and where, therefore, if capital were farther extended,

the profit might be annihilated, or even converted into loss. A country, though well governed, yet if new, may have its profits high, because of the unbroken tracts which yet lie open for cultivation, as in the United States of America; and on which the exuberance of capital may overflow, and find profitable investments for generations to come. And a country, though old, yet if ill governed, may also have its profits high. The insecurity to which all property is exposed, from injustice and violence, will prevent the wealthy, in such countries, from exposing their capital, without the promise of a considerable return. The high profit is an indemnification for risk; and should be equal to the ordinary profit in ordinary circumstances, with a premium, over and above, for a very hazardous insurance. In balancing the matter between the value of a present indulgence, and that of a future acquisition, the uncertainty attendant on the latter, will tempt merchants to give a larger proportion of their gains to expenditure, and this, by keeping down their capital, upholds their profit. It is in perfect accordance with this, that, in countries under oppression, the cultivation should have made so short a descent among the inferior soils. The same consideration which operates in restraining the application of mercantile, will also operate in restraining the application of agricultural capital; the latter of which requires, as much as the former, the inducement of a large return in barbarous or demi-barbarous countries. Hence the prodigious

capability of soils that lie without the margin of cultivation, in far the greater number of countries in the world—in Asia Minor, in South America, in Hindostan, along the Northern shores of Africa, and, generally speaking, in all territories under the Mahometan yoke. This holds out the brilliant perspective of a great enlargement in the physical resources of the human family, as being the sure attendant of their growth in morality, and religion, and social order. Even the larger countries of civilized Europe have still this prospect in reserve for them; as is evident from the higher interest of money, in conjunction with the yet imperfect agriculture of such countries as Spain, and Austria, and Russia, and Poland. Perhaps there is no first-rate nation so near, in this respect, to its extreme limit as Britain, that has long been the seat of pure legislation, and of safe and prosperous industry. There, a low interest, a high-wrought agriculture, the distress both of a redundant population among the labourers, and of a redundant capital among the mercantile classes, go hand in hand. Ireland, with its higher interest of money, and its less perfect agriculture, has yet a career of greater advancement to describe than there is now room for in this country. One of the recipes often given for the medication of that interesting land, is to pour capital into it. But this is mistaking the consequence for the cause. The economic will follow spontaneously in the train of the moral improvement. With the progress of education, and

law, and industry, capital will naturally be attracted hither ; and, what is still better, a capital of home-growth augmentation will speedily be formed. Then slovenly agriculture, and unreclaimed wastes, are to us the materials of a cheering anticipation ; for they tell how large are the still undeveloped capabilities of Ireland. The redundancy of the Irish population, is only, as compared not with the potential, but with the actual amount and distribution of their produce, an amount which might be doubled with a better system of husbandry, and a distribution which will become more thoroughly internal than at present, when landlords begin to feel, that on their own estates, and among their own peasantry, they may taste the charm and tranquillity of home. It is competent for moral causes, and for these alone, to effect every desirable amelioration ; and, if man would but do his part, nature has in store for Ireland a liberal subsistence for millions more of human beings than are now famishing upon its territory.

15. If the disease in Ireland be a plethora of population, the disease in this country is more like to a plethora of capital. If there, the mendicity be among the living instruments ; here, if I may be permitted such an image, the mendicity is among the dead instruments of labour. If there, immediate labour be wretchedly remunerated by a low wage ; here, the low profit makes a wretched remuneration for antecedent labour. The phenomena on this side of the water indicate as surely

that capital has its limits, as the phenomena on the other side indicate that population has its limits. The annoyance one feels in the competition of porters for employment, is not more decisive of the one, than the annoyance he is exposed to from the competition of steam-boats or hackney-coaches is decisive of the other. The noisy clamour of beggars on the street, does not tell more significantly of an excess of population, than the signs of unoccupied houses, and the flaming advertisements of commodities at prime cost, and the incessant cheapening of articles to the bankruptcy and ruin of their owners, tell by another sort of clamour of the excess of capital. Between the two elements, in fact, there is a marvellous and multiplied accordancy. Both are subject to incessant checks from the want, each of its own proper aliment; the one from an insufficient wage, the other from an insufficient profit. And though both are greatly short, at present, of that magnitude which they may yet attain in the course of ages; both may press at all times on a slowly-retiring limit—nor is there room in the world for the indefinite extension of either.

CHAPTER V.

ON THE POSSIBILITY OF OVER-PRODUCTION, OR OF A
GENERAL GLUT.

1. BY our division of labourers into three classes, we are enabled to refute the modern paradox, of the impossibility of over-production, or the impossibility of a general glut. They who maintain this doctrine, represent what they term unproductive consumption, or unproductive expenditure, as an injury to the nation. They know, that though all wealth were turned into capital, there would just be as much expenditure as before; but it would be expenditure on the tools and materials, or on the maintenance of industry. Instead of spending my income of a thousand guineas in the year, it is certainly possible to stint myself to fifty pounds; and either directly, or through the medium of a loan, I may spend a thousand pounds annually in the employment of labourers, who shall work up a return for the maintenance bestowed on them. It is in virtue of this return, that the latter mode of spending a thousand pounds, has, in opposition to the former, been termed productive expenditure, when viewed as coming from the hands of the employer; or productive consumption, if viewed as going to the maintenance of so many workmen and

their families. And their workmanship is the product—a product that we should not have had, if the owner of the sum, instead of giving it the supposed destination, had spent it on his own personal or family indulgences.

2. The thing wanted, therefore, by these new economists, is, that each man, laying out as much as possible of his income on productive expenditure, should lay out as little as possible on his own individual enjoyments. And this can certainly be done, till the man reduce himself to the necessities of life. This is the extreme limit of the possibility in regard to him ; and the extreme limit in regard to the country at large, might be reached by all men of wealth, higher than that of a labourer, doing the same thing ; that is, confining themselves to the use of necessities, and spending the surplus, not in the purchase of existent products for their own and their families further enjoyment, but in the maintenance of workmen whom they put to the formation of new products. At this rate it is obvious, that all luxuries would be proscribed. These products would fall out of demand, and cease to be fabricated. The men now employed in their fabrication would still continue to be supported, and by the same people too—only, instead of being supported by them in the act of spending their revenue on the old and customary products, they would be supported by them in the act of laying out that revenue, now turned into capital, on the manufacture of new products. And these

products, in virtue of this universal change that had taken place in expenditure, behoved to be either the first or second necessities; seeing that, when society was brought to this state of alleged optimism, all men behoved to confine themselves to the use of necessities, and devote the surplus of their incomes to that production, which it is impossible by this new doctrine to carry to excess. That this new production should be a production of luxuries, after the use of luxuries has been thus proscribed, and banished from the land, is surely out of the question. If production at all, it must be that of the first and second necessities. In other words, by this change, the disposable population would be, not destroyed, but transferred. The class would be destroyed,—but the men who compose it would be supported, and as well supported as before, in other employments; or merged into the other two classes of agricultural and secondary labourers.

3. By tracing the effect of such a change in the habit of expenditure, (were it possible, which it is not, that such a change could be realized,) we shall find that it would be productive of no real benefit or blessing to society. We might perhaps satisfy ourselves with the certainty, that it is a thing not to be done,—but we hold it of importance furthermore to know, that, it is a thing not to be desiderated. At all events it will be found, in the course of the investigation, that this new doctrine, of the impossibility of a general glut, is altogether a chi-

meia. And, like many other important lessons in political economy, we think that this one too can best be learned at the extremity of cultivation,—at the limit of a country's food, beyond which it is utterly impossible to carry any one economic interest, that is dependent either on the number of human beings, or on the industry of human hands.

4. First, then, let us imagine that the farmer, in any given state of the husbandry, lays out, and persists in laying out, the uttermost he possibly can, on the business of that production wherewith he has to do. There can be no doubt, that the less he spends upon himself, and the more he spends upon his business, the faster will he carry out upon his land the limit of cultivation. Even when he has reached that soil, which can yield no more than his profit, over and above the food of its direct and secondary labourers, he may still persevere in making a surrender of that profit; and, instead of consuming it on his own enjoyments, may continue to put it out on the expenses of a further cultivation. With this determined sacrifice, year after year, of all the profits of his husbandry, he will not only carry out the cultivation at a faster rate, but he will carry it further than he could otherwise have done. He may be obliged to stop at last, when he comes to a soil which yields him no profit, and which can barely feed the agricultural labourers and their secondaries; but yet he stops at a line ulterior to that which would have bounded his progress, had he been

in the habit of spending the profits upon his family, instead of sinking them upon his farm. The land last entered on, would be further down in the gradation of qualities of soil, because it would have less to do; having only to yield the food of its direct and indirect labourers, instead of having both to yield that much, and a profit to the cultivator besides. This attempt, then, at production, on the part of the farmer, to the uttermost of his power—this surrender of his own profits to the cause, must give a certain stretch to cultivation, and be the means of reclaiming a belt that would have otherwise remained on the exterior of the domain of cultivation. There would have been room thus afforded for a larger, but not certainly on that account for a happier or a richer population. Their comfort, in fact, depending as it does, not on the absolute quantity of food, but on the relation which the quantity bears to their own number; and this, again, depending on their own standard of taste and of enjoyment,—all that the extreme parsimony of the farmer can work out for us, is a bulkier, but not a better-conditioned society than before; a greater number of families, but these not at all more thriving families than they were formerly. Let us state truly the effect of this straining after production, with all his might and all his means, on the part of the cultivator. He annihilates his own profit by it. He adds something to the magnitude of the commonwealth. He adds nothing to the prosperity or comfort of the individuals who compose it.

5. It seems needless to make a distinct argument, for it is essentially the same on the case of another species of capitalist; even him who heads, and who by his funds sustains, the manufacture of second necessities. He, too, like his brother agriculturist, may, in his zeal for production, choose to live as a labourer, and to embark all profit on the enlargement of his concern. The consequence would be a larger supply of second necessities, and such a consequent cheapening of them, that profit should be annihilated. We have already demonstrated how this, too, would give a stretch to cultivation. It would, *pro tanto*, have the same effect, in this way, that we ascribed to the cheapening of second necessities, by an improvement in the machinery employed to prepare them. It would not of itself lessen the number of secondary labourers requisite for this preparation. The last land would still have to feed the same number of these. But it would have no longer to feed the disposable population, that went to be employed in the preparation of luxuries for the manufacturing capitalist. He, by the supposition, has given up this idle expenditure, and embarked all the proceeds of his retrenchment on the extension of his business. The effect of thus freeing the last land from the burden of subsisting so many as would have been otherwise required of it, is just to enable the cultivator to make a step down to worse land. By this change in the habit of the capitalist, a few of the disposable class would be transferred, as in the

former case, to the business of a now more extended agriculture; and, with the consequent increase of population, to the business of a then proportionally extended manufacture of second necessities. In both cases, there might be a temporary enlargement of comfort to labourers. But this, so long as the standard of enjoyment remained the same, would soon be followed up, and therefore compensated, by an increase of population. And so the result of this second effort at an indefinite production, would come, like the first, to a very definite and limited result. It would annihilate profit. It would add something to the magnitude of the commonwealth. It would ultimately, or permanently, add nothing to the prosperity and comfort of its individual families.

6. But the extension of agriculture that would ensue from capitalists, whether agricultural or manufacturing, giving up their profits, is as nothing to the extension that would ensue from landed proprietors giving up their rents in the cause. We need not make a separate case of the capitalists employed in the manufacture of luxuries,—for the most which they could surrender to the object of increasing production, is the profits of their business. But were their great customers, the landlords, to be enlisted in this warfare against all unproductive expenditure, they could, by giving up the use of whatever is superfluous, turn, not merely the profit made on luxuries, but the whole price of luxuries, to the purposes of

capital. The most that capitalists could do, by a yearly sinking of their profits, would be to carry down the cultivation to the soil that barely feeds the labourers, directly and secondarily employed on it. But landlords, by a yearly sinking of their rents, could do a great deal more; could make, in fact, the cultivation pass a very far way beyond this line among the deficient soils.* With the exception of their own essential maintenance, which they might reduce to that of labourers, they could turn the whole of their immense revenues into capital, for the object of production; though, from the universal change which we now suppose in the state of the demand, it behoved to be the production of first and second necessities. Of course, the present employments of the disposable population would be completely broken up, and we should behold them spread in immense numbers over the deficient soils of the territory,—where they would be supported, partly by the scanty and inadequate returns of their penurious husbandry; but this made up by the successive outlays of that revenue which landlords drew from their superior soils. In effect, this scheme of production, to the uttermost, would give rise to the very same distribution, and be attended by the same consequences, with a scheme of home-colonization carried to the uttermost. The landlords would only be denuded

* We name those the deficient soils whose produce is insufficient for the subsistence of their direct and secondary labourers.

of their revenues in a somewhat different capacity ; not in that of philanthropists or leypayers, but in the capacity of over-traders. The ultimate effect of that system which the enemies of unproductive expenditure so strenuously recommend, supposing it carried to the uttermost, would be a regular yearly investiture of all the superfluous revenue of landlords ; and that followed up, by as regular a yearly loss to them of the whole sums invested. There would not be the extinction of rent from the superior soils ; but there would be the absorption of it on the deficient soils. There would be the extinction of a disposable population. There would be a considerable increase of the general population ; but with this addition to the number, there would most assuredly be no addition to the comfort of families. With the surrender of luxuries on the part of the landlords, agriculture could be carried a great way beyond its natural limit ; yet it is not illimitable. When the last luxury had been given up, and the last man been withdrawn from the disposable population, then would agriculture reach the farthest possible barrier which nature and necessity had laid in the way of its extension—as the beach, or the sandy desert, or the impracticable rock, or the climate of eternal frost, within which no esculent can be reared.

7. Our first remark on this process of indefinite parsimony, and of laying forth to the uttermost on production, is, that it never can be realized. We

have endeavoured to trace its effects, but we are quite sure, all the while, that they never can be exemplified. Capitalists will not persist in stinting themselves to the bare necessities of life, and laying out the whole surplus of their profits on the extension of their business, when they come to find, that, after all, these profits are at length annihilated. Landlords will not persist in foregoing such indulgences as might be spared, if they come to find, that any returns which might be made only go to make out the support of an inc̄reasing population, instead of coming back in the shape of additional wealth, and additional command over the enjoyments of life to themselves. No man would continue to superintend the operations of a capital, no man would continue to administer and manage the affairs of a landed property, if such were to be the result of it. The moving forces which actuate, and which lead either to the operations of merchandise, or to the arrangements of agriculture, would cease, on this system of production to the uttermost, and of no consumption save for the object of production. If such a system were once entered on, it would speedily be checked by its profitless, and, in many instances, by its positively losing and ruinous results. So that it is not in opposition to any apprehended practical evil, but in opposition to a theory, that we have been induced to frame, or at all to insist on our present argument.

8. But even though practicable, we should hold

it to be a process not at all desirable. That it would hasten the progress of agriculture, and so the growth of society in respect of population, is very certain. With a less amount of frugality in times past, we should have had, at this moment, a narrower domain of cultivation; and a domain so much the larger and more productive, had there been greater frugality, even though many owners and occupiers of land had starved or ruined themselves in the cause. There can be no doubt, that cultivation has often received a permanent stretch at the expense of an irrecoverable loss to the individual cultivator; and that, better than this, instances can be named, where, but for a large outlay on the part of owners, there are many extended improvements, at length yielding an ample, though distant return, which might have been postponed or never undertaken. Yet, with all these admissions, while we should deprecate the encroachments, by waste and extravagance, on agricultural capital; we should also deprecate the encroachments by parsimony, on the general habit of capitalists living in the enjoyment of their profits, and land-owners in the enjoyment of their rents. For ourselves, we have no fear whatever of the former encroachment, and would again advert to that beautiful compensation, by which the excessive love of present enjoyment on the part of spendthrifts, when carried to the length of abridging their capital, does, by its effect on supply and price, call forth a counteractive force in the opposite direction—by inviting

others in whom the love of gain predominates, the more to extend their operations, whether in trade or in husbandry. We have no alarm for the effect of economic theories on the habit of individuals ; but even though they had the influence, which they have not, we should hold it a thing to be regretted, if they led our capitalists either to spend more, or to spare more, than they would spontaneously. We should rather confide the progress of agriculture to the improvement of its own machinery, and its own methods, than hasten that progress unnaturally by an extreme parsimony, whether among the owners or the occupiers of land. We have no demand for a forced increase either of food or population ; neither do we look on that system as being at all friendly to our species, which, by an abridgment on the free control of every man over his own revenue, would either speed the advances of cultivation beyond the rate at which it might otherwise proceed, or carry it beyond the boundary at which it would otherwise stop. The final result of such a system, when consummated and brought to its perfection, were an agriculture carried not merely to the limit beyond which it could not produce so much as pay its own expenses, but to the limit beyond which it could not produce at all. Our preference is for an agriculture that stopped at the upper extremity of the deficient soils, rather than an agriculture that did not stop till it reached their lower extremity. In very proportion to the progress made among the deficient soils, are profits

and rent encroached upon, and the disposable class dwindles away by successive abridgments, till the last man is transferred to the agricultural or the secondary. We repeat, that we have no value for such a consummation; and, infinitely rather than this ultra agrarianism, would we have a more limited, because, along with this, we should also have the composition and the materials of a more secure and far happier society. We see not the good of an addition to the mere numbers of the commonwealth, if it can only be effected at the expense of the whole, and to the utter ruin of certain great interests which cannot otherwise be provided for than with a disposable population; implying, no doubt, the means of leisure and luxury to an opulent class, but implying also, beside a thousand bland and beneficent influences on the comfort and moral state of all classes, an ability on the part of the ruling power, to appropriate of these means for all the best and highest objects of an enlightened patriotism.

9. This is a great question; and something of far mightier import than the maintenance of a rank and a property for the upper classes is involved in the determination of it. We hold that, on the moment when agriculture overpasses its natural limit, and enters on the deficient soils, the condition of the general peasantry is put into a state of fearful precariousness. And it matters not whether this shall happen by a scheme of home-colonization for the purposes of charity, or by the schemes

and speculations of over-trading, either for the sake of a profit that wont be realized, or on the false system, that all unproductive expenditure is ruinous. If the first, or an undertaking of charity for the good of others, we can prove, that though it may land us in a greater, it will land us also in a more wretched population.* If the second, or an undertaking of business for the good of ourselves, it cannot long be persisted in under a continued experience of the losses which are incurred by it; and it is always to the distress of multitudes, when any enterprise of industry, because of its unproductiveness, behoves to be abandoned. We therefore deem it an alternative altogether big with efficacy on the ultimate condition of our species, whether they shall keep within the natural limit, or, breaking through among the deficient soils, push onward to the extreme limit of the agriculture. Our preference is wholly, and that for the sake of the prosperity of all classes, to the former term of this alternative. We should rather the liberal consumption of their rents, than the yearly absorption of them in losing schemes of husbandry, on the part of the landed proprietors. We should rather a high rate of profit, upheld by a large expenditure on the part of capitalists, than the utter degradation of this class by a parsimony that would annihilate profit, and sink their condition to that of the general population; even although this larger expenditure and larger profit did somewhat retard the

* Again see the Appendix, C

progress of agriculture. And we should infinitely rather, on the part of labourers, behold them keeping within the superior soils, in more limited number, but in larger sufficiency, than flowing over on the deficient soils, and there bringing down, by the very weight of their redundancy, the state and circumstances of the whole order to which they belong. We are sensible that, at this rate, we should have a more contracted agriculture, and therefore a less populous world, but our preference is for a higher wage and higher profit too, with a narrower, rather than a lower wage and profit with a wider cultivation. It is at the natural limit of cultivation, that we should feel disposed to take our most resolute stand—assured as we are, that if the attempt to pass beyond it be, from whatever cause, largely and systematically prosecuted, a general want and wretchedness among labourers or capitalists, or both, would follow in its train.

10. But it is now time for addressing ourselves to the argument of our more recent economists, for the impossibility of a general glut, in the terms which they themselves have employed when propounding it. Their reason for there being no such thing as over-production, or for a general glut being impossible, is, that any partial over-stockings of the market which may accrue, arise, not from an excess of commodities upon the whole, but from the excess of certain commodities, and so a wrong or mistaken distribution of them. They ground their proposition on the indefiniteness of human

wants, or rather, of human desires, in virtue of which, they affirm, there can be no excess in the supply, if known only what the desires specially are. The mal-adjustment in the market, according to them, has arisen, not from the desires of men being over-satiated with too many objects, but from these desires not being met by the right objects. If, for example, there be an excessive quantity of cotton goods in the market, they become immoderately cheap, and purchase less than they otherwise would, of all other commodities, which of course are, in reference to this one commodity, immoderately dear. This must proceed, it is argued, from an excess of labour employed in the preparation of cotton goods, and a corresponding deficiency of labour in the preparation of the other articles which come into exchange with them. Had a certain portion of labour, then, been transferred from that quarter where it has been in excess, to those quarters in which it has been deficient, the equilibrium would have been restored, and the cotton goods been exchanged, with all others, at a fair relative value. At this rate, there would have been no glut of any one commodity; and yet the quantity of commodities on the whole would have been as large as ever. On these grounds it is contended, that there can be no glut arising from over-production in the general, but only from a miscalculation as to the real state of the demand; and so a disproportionately large supply of certain articles of merchandise, with a corresponding defect and diminution in the supply of others.

11. Now, in the first place, it must be obvious, that so long as the food of a country is ahead of its population, there is no danger of such a general glut extending to all commodities, as shall produce general distress among labourers; and less danger than otherwise, of such a partial glut in some of them, as shall bring distress to certain classes of labourers. The holders of this food, are the holders of that which is the chief ingredient in the maintenance of families; and, holding it in excess, there can be no doubt, on the average, of an ample remuneration for the products of manufacturing industry. Even should the first holders, the landed proprietors, confine themselves exclusively to the use of certain favourite commodities, and neglect the others; by their more intense demand for the former, they raise their price, and transfer to the venders of certain articles the whole of that surplus food, which might have otherwise been distributed among the venders of all articles. But after this food, or, which is the same thing, the power of lifting it, has been placed in the hands of the second holders, the fortunate calculators on the taste of the original ones, there will still be a surplus to them, the whole food being in excess to the population, which, rather than left to moulder in their own idle possession, will find its way either to such articles as can be found, or to the purchase of labour for the preparation of other articles. It is thus that, in the state now supposed, the products of industry will seldom miss being exchanged with

a liberal maintenance to workmen ; or, at all events, workmen will seldom miss of a liberal maintenance. Capitalists may suffer a diminution in their gains, or even a positive loss, by miscalculation. But, in a general excess of food, this will not affect the general comfort of labourers, as exemplified now in America, and as perhaps exemplified in various stages in the enlargement of European agriculture, since the termination of the middle ages.

12. But periods of general comfort are periods of frequent and early marriages ; and so of more frequent, as well as larger families. An increasing population follows in the train of increasing food, and at length overtakes and presses on it. That the pressure be felt, even long before the agriculture has come to its uttermost perfection, it is enough if the rate of increase in the population exceed the rate of increase in the means of subsistence. The nearer the agriculture is to its extreme limit, the pressure will be the more felt ; and it will be greatest of all, when, instead of a slowly-receding barrier, the food of the country has reached its maximum, and the barrier has become stationary. Hence the straits that is felt in the old countries of Europe, as marked by the tide of emigration, compared with America ; where vast tracts of yet unbroken land await the enterprise of adventurers, and afford additional harbourage for additional millions of families. It is in the former countries, where those gluts, which create a reaction of poverty and distress amongst the working classes, are of most fre-

quent occurrence. It is there that miscalculation occurs most readily, and it is also followed up by the severest consequences. It is in countries of saturated population, where the workmen who had been engaged in the preparation of a neglected commodity, experience the most fearful distress, when dismissed in thousands by their employers, because unable, from the want of returns, to uphold their establishments. Had this taken place in a country where there was a sufficiency of food for all, the discarded labourers might still have met with their subsistence in return for some new service to those who were the holders of it. But there is no such resource, when the food is already engrossed by those more fortunate of their class, who have been engaged in the preparation of the more favoured commodities. It is thus that, in every country so situated, when there is any disproportion among the manufactured articles which are brought to market, there must fall a weight of suffering on certain classes of the industrious, even the makers of the articles which are in excess. But it is a mistake to imagine, that, by simply rectifying this disproportion, the suffering will be done away. It would only be more divided than before. There might be no increase of severe distress in any one quarter; but in exchange for this, there would be a straitness and certain feeling of penury amongst all the operatives in the land. Still there would be a glut, though not proceeding from excess in certain *manufactured* articles, with a corresponding de-

ficiency in others. After the adjustment of the best relative proportion had been established between them, there would remain a glut of these commodities upon the whole; and that proceeding from an anterior glut, not to be rectified by any skill in the transference or new distribution of capital; even a glut of human beings, which nothing can prevent, but the reign of prudence and principle amongst families; and nothing can correct, but the famine, and disease, and war, which are so many chastisements inflicted by the hand of nature, on human guilt and human improvidence.

13. It is vain to say, that, in these circumstances, a transference of labour should be made from manufactures to agriculture. We have already seen, that there is not room for an indefinite employment of labourers in the one department more than in the other. The population who are now working on the land last entered, or on the land that is placed along the extreme margin of cultivation, only obtain from it a produce which feeds the agricultural labourers and their secondaries, and which remunerates the capitalists. An additional population, if it anticipate and exceed the natural progress of agriculture, as already explained, behoved to enter upon land of inferior quality to this; which land could only continue to be cultivated with loss to the capitalists, or by means of an under-fed or inferiorly-maintained population. It is thus, that there can be demonstrated to exist a limit all round to the employment of labourers.

And for the right direction of philanthropy, for the purpose of giving effect to her devices and her doings, to save the wasteful or the pernicious expenditure of her powers, it is well that all the false lights should be extinguished, which may have heretofore bewildered her, and that she should be no longer misled by a delusive confidence in impotent or fruitless expedients.

14. There is nothing more fitted to inspire this delusive confidence, than the doctrine which we now endeavour to expose. It suggests the idea of an indefinite harbourage for the people, let them multiply and increase to whatever extent they may. It gives a virtue unlimited to credit and commerce, and the enterprise of merchants; and removes from contemplation that barrier to the extension of agriculture, which must ever prove a barrier, alike firm and impracticable to the extension of trade. It overlooks the obvious truth, that there may be too much production, just because there may be too many producers. It is this which may give rise to a general glut, at least of all but the first necessities of life. It is but a poor evasion, that because there is a deficiency in these, the glut is not universal; so that if all sorts of products were included, the doctrine has still a foundation to rest upon. It needs but one qualification to meet this. *Generally*, and with one single exception, even that of food, there may be an excess of products; and *universally*, or inclusive of food and of all things else, there may be an excess of productive

being in defect, and all other commodities in excess; and that so a rectification would be brought about, were a portion of the capital transferred from the preparation of the latter to that of the former—or, speaking generally, from manufactures to agriculture. But this goes on the presumption that food can be raised by turning capital to this object, just as indefinitely as houses, or ships, or steam-engines, can be multiplied in the same way. The state of matters at the extreme margin of cultivation is not adverted to. It is forgotten why, in the present circumstances of the country, that is the margin; and why it cannot, without loss, be carried further onward or downward than it actually has been. The unutilized land would not, in the present state of agricultural science, feed both the primary and secondary population who should be employed on it. At least, it would not do this, and also remunerate the capitalist for his outlay. Nay, there is the utmost hazard, or rather certainty, in such a state, of lighting upon soils so ungrateful, as to convert profit into loss, and so diminish the capital. It were well if this check to indefinite enlargement could be fully kept in view; for a recklessness to limits, and necessary laws on the part of the *savans* in political economy, might induce a corresponding recklessness on the policy of statesmen, and even on the general habits of society. There are certain recent doctrines in the science, which, beside being unfounded in themselves, have precisely this effect. In particular,

the position that there is no limit whatever to the means of productive and profitable employment, is really tantamount to the position, that there is no necessary limit on the numbers of the species. If work can thus be augmented indefinitely, then might workmen be augmented indefinitely. It is under the influence of some such maxim as this, that a delusive confidence is encouraged, and relief for a straitened and over-burdened community is always sought for in the wrong quarter—in the enlargement of work, rather than the limitation of workmen—in the increase of produce, when nothing will effectually or permanently keep the country at ease, but a check on the increase of population.

16. We feel unwilling to protract an argument already too much lengthened out ; else, instead of viewing the outlay of capital for the sake of production in the form of a material, we might proceed to view it in the form of a monied investiture. Under this distinct aspect, the reasoning might be so managed as not only to demonstrate a fallacy in the conclusion of our adversaries, but to detect a fallacy in the assumption on which their argument rests. And a further advantage would be, that without adverting to the limit of agriculture at all, the possibility of a universal glut might be established, in whatever state or at whatever stage society might be,—whether bordering on the extremity of its resources, as in some countries of Europe ; or in the rapid progression of infancy and

youth, as in America. Let any country be imagined, whose monied capital for the year amounts to a hundred millions, which by one revolution is replaced with a profit of ten millions, to be expended by the capitalists in the shape of revenue. Matters might be conceived to go on easily and prosperously at this rate, with a fair wage to the workmen, and a fair profit to their employers. And yet even here, without supposing any glut of men, there might be produced a glut of commodities; and that simply, from an increased desire, beyond a certain limit, on the part of the wealthy to become wealthier still. Under the influence of this desire, consumers might, at one and the same time, be led to save, and capitalists to speculate. Landed proprietors, for example, might by dint of economy abridge their expenditure by twenty millions in the year; and, instead of laying it out on those ultimate soils that would not repay, might lay it up in banks, and with the prospect of an interest for the sum deposited. This sum, on the other hand, lent out to capitalists, will increase their facilities of speculation, and extend the monied capital embarked in production, from one hundred to a hundred and twenty millions.* In this

* Here it may be said, that the capitalists will still have to start anew with only a hundred millions, because the twenty millions which they have borrowed, only come in place of the twenty millions that were withdrawn from expenditure the year before, and by which sum their capital fell short of being replaced in the last revolution of the economic cycle. This is only saying, that the glut takes place a year earlier than we think necessary to insist upon for the purposes of our argument.

ratio then, will the monied cost of the country's products be increased, but what is the result when they are brought to market? Instead of being met by a proportional monied price, they will be met by a returning power, just as much reduced as the producing power has been increased. The twenty millions that have passed from one side to the other, will overturn, for one year at least, the balance between production and consumption, and that year there is an over-production or glut, to the annihilation of all profit, and the positive loss of thirty millions over and above—or even of forty millions, if the capitalists spend as much in the shape of revenue as before. At all events, the capital of a hundred and twenty millions, laid out on commodities, would be met by ninety millions only on the part of purchasers.

17. It cannot surely be said, in this instance, that still the producers had erred in working up more of certain commodities than were wanted. Their error simply lay in over-production; and this was an error, from the consequences of which no imaginable shifting of the production to other commodities could have saved them. What new accommodation to the taste of their customers who had only ninety millions to spend, could have enabled them to dispose with a profit, the hundred and twenty millions' worth of goods which they had brought to market? The consumers did not want other commodities in lieu of those which were presented. They simply wanted to be richer than

before ; and that, not by possessing themselves in greater abundance than before of certain special commodities, but by possessing themselves of a greater general power than before to purchase all commodities. It is the oversight of this distinction, we think, which has led to this new doctrine on the subject of gluts. When a consumer refuses certain commodities, it is not always, as has been assumed, because he wants to purchase others in preference—but he wants to reserve entire the general power of purchasing. And when a merchant brings commodities to market, it is not generally in quest of other commodities to be given in return for them ; so that were these other commodities in defect, then had a portion of the capital expended on the first been transferred to the second, the balance would have been restored ; and neither set of commodities being either too cheap or too dear, there would have been a glut of neither. This is not the way of it. The proper object of the merchant is not to obtain, in return for the articles wherein he deals, any one species of commodities more than another ; but it is to extend his general power of purchasing all commodities. It makes no valid evasion, that money is a commodity. This may complicate the question, but does not affect its essential character. The truth is, that the real metallic money for which a merchant has any use, does not amount to more than a small fraction of his capital, even of his monied capital ; all of which, though estimated in money, can be made,

on the strength of written contracts, to describe its orbit, and be effective for all its purposes, with the aid no doubt of coin, but of coin amounting to an insignificant proportion of the whole. The great object of the monied capitalist, in fact, is to add to the *nominal* amount of his fortune. It is that, if expressed pecuniarily this year by twenty thousand pounds for example, it should be expressed pecuniarily next year by twenty-four thousand pounds. To advance his capital, *as estimated in money*, is the only way in which he can advance his interest as a merchant. The importance of this object to him is not affected by fluctuations in the currency, or by a change in the real value of money. It is possible that he may succeed in advancing his fortune, by the business of one year, from twenty to twenty-four thousand pounds; and yet, from a decline in the value of money, he may not have increased thereby his command over the comforts and conveniences of life. Still it was as much his interest to have engaged in the business, as if money had not so fallen; for else, his monied fortune would have remained stationary, and his real wealth would have declined in the proportion of 24 to 20. Better than lose this ground, is it for him to have laboured as he did, even though he should only succeed in keeping himself even with what he was at the outset. So that the great aim of every trading capitalist is, to increase his fortune as estimated in money. Commodities are not his terminating object, save in the spending

of his revenue, and when he purchases for the sake of consumption. In the outlay of his capital, and when he purchases for the sake of production, money is his terminating object. If he start at present with a certain sum expressed in pounds, shillings, and pence, the great end of his exertion or enterprise is, that after the current speculation is completed, he might start anew on another speculation, with a larger sum, expressed as before in pounds, shillings, and pence; whether these have meanwhile increased or decreased in their value. Had this consideration been kept in view, we feel persuaded, that the doctrine of the impossibility of a universal glut would never have been famed.

18. There is nothing in the operations of credit to affect, but rather to confirm this reasoning. Generally speaking, when men trade upon credit, the only difference which it makes is, that they trade not with their own capital, but with that of other people; and there is nought surely in this, which should lead us to modify any of our conclusions on the subject of capital. Very often too, when trading upon credit, it is not strictly with the capital of others; and yet it may be a credit which has a substantial basis to rest upon. A landed proprietor may bind himself to a future payment, in a written deed or instrument which he makes over to a trader; and in this way, a species of wealth, that is not fitted in itself to perform the functions of moneyed capital, is made available for this end. The truth is, that his written engage-

ments, just like the notes issued by a bank whose credit is unexceptionable, because grounded on the immense landed wealth of its proprietors, have in them all the virtue of money. It is curious to trace the effect of such an operation. We can imagine an additional ten millions created in this way; and that at a time when the trade of the country was moving evenly and surely, with the annual outlay of capital to the extent of a hundred millions, and the return of a hundred and ten. If the additional ten millions that we now suppose, are created for the purposes of speculation, this has just the effect of advancing the cost of all the means and materials of manufacture; and so, causing an outlay of a hundred and ten with the old return of a hundred and ten, profit would be annihilated. If the additional ten millions be created for the purposes of extravagance, this has just the effect of advancing the price of all the finished articles in trade and manufactures; and so, causing a return of a hundred and twenty to the old outlay of a hundred, profit would be advanced from ten to twenty millions. In either way there would be effected, not the reduction of wealth, but the rotation of it. Should landed proprietors overspeculate to the extent of ten millions, to that extent do they mortgage their estates; and their creditors may be traced to the holders of the means and materials in manufacture, who, by a commensurate rise in the price of these, have become as much richer as the speculatists have become poorer. Or, should landed

proprietors overspend to the extent of ten millions, to that extent also do they mortgage their estates; and their creditors may be traced to the holders of all sorts of finished articles for sale, who, by a commensurate rise in the price of these, have become as much richer as the spendthrifts have become poorer. In the latter case, the error lies in turning to revenue that which should have been suffered to remain unalienated and undisturbed in the bosom of their property. In the former case, the error (and in spite of all the demand which there is by economists for capital to the uttermost, and production to the uttermost, the one is just as great an error as the other) lies in turning to capital that which should have been suffered to remain alike undisturbed and unalienated.

19. However interesting to pursue credit into all its issues and final consequences, we must not detain ourselves among the varieties and numerous modifications of which it is susceptible. We shall only instance the case when credit is entirely fictitious, but in virtue of a delusive confidence obtains currency to its notes or instruments for a time—as to the bills which are drawn and accepted by men of no capital, and the issue of engagements by a bank beyond its power of liquidation, should they have been turned to the prosecution of rash and ruinous undertakings. These, while their credit lasts, have the same power of effecting exchanges as money itself has; and one can imagine, that in this way there may be sent afloat into the world of

enterprise an additional sum of ten millions, while the whole pecuniary returns for the outlay of mortgaged capital were the same as before. There behoved, in consequence, to be a diminution of profit to the extent of ten millions. Amid the general losses which ensue by this overtrading, the adventurers, it is possible, may come in for a fractional share of the returns along with the previous traders amongst whom they have thrust themselves. But in as far as fictitious credit in the hands of some has thus made good its encroachments, it will be found to have been by the shifting of a solid capital that was before in the hand of others, now elbowed out by the more fortunate gamblers who have succeeded them. One melancholy effect often is, that labourers, thrown adrift and defrauded of their wages, have to live many days in penury. But for this excessive and unwarrantable speculation, they may have continued in their wonted fullness; so that, in this instance too, capital may be said to have been forced, though by anticipation, out of that which should have been left to its proper destination; and which, instead of being speculated with by merchants in the shape of capital, ought to have been spent by workmen in the shape of revenue.

20. At all events, the phenomena of credit, though we can afford to dwell upon them no longer, lend the most ample and satisfactory confirmation to our views on the subject of capital. In a season of great commercial distress, occasioned by many

failures, we often hear the calamity ascribed to so many people trading upon credit, instead of trading with capitals of their own. But this very circumstance proves, that capital cannot be carried beyond a certain limit in any country. Grant that the sum embarked this year on mercantile transactions, was raised by credit from a hundred to a hundred and ten millions, there need have been no failure, had the return for this sum, in the price of the goods prepared and brought by it to market, been a hundred and ten millions, with a sufficient profit beside to all who were engaged. But if, instead of this, the return is but a hundred and ten millions without any profit, then, on the supposition that capitalists have lived as usual, there must be failures to the amount of ten millions. It is not, however, the mere circumstance of these commodities being manufactured partly by capital and partly by credit, that has produced this result. It is simply the excess of commodities over the effective demand for them; an excess that would have been the same although wrought up altogether on capital, instead of partly on capital and partly on credit. If, after that a hundred millions were embarked on the yearly business of the country, there was no room for adventurers trading in addition on a credit of ten millions, there would have been just as little room for them trading to this amount with capitals of their own. The same loss would have ensued, with this only difference, that capitalists to the amount of ten millions would have lost their

own, instead of adventurers losing the same sum to other people. In the one case, the rash adventurers and they who trusted them, would have received their chastisement. In the other case, the excess of capital would have been lopped off. Whether it be an excess of production from rash adventure or redundant capital, the result is altogether similar. And thus it is, that just as population, when pressing on the food of a country, limited in its power of subsisting labourers, receives a check by poverty and disease; so capital, when pressing on the business of a country, limited in its power of returning the outlays with a profit, receives as effectual a check by the losses of real, and the bankruptcies of fictitious capitalists.

21. In conclusion, we would only observe, though at the hazard of some reiteration, that the number of human beings in a country, is very nearly on a level with the amount of human subsistence, and tends to go beyond it. Labour is the return given by the general population, to those who uphold them in the necessaries of life; and the products of this labour, may be either turned by their owners into self-consumption, or laid up by them for the purpose of future production. But just as labourers cannot be multiplied beyond the possibility of a wage to sustain them, so neither will the products of antecedent labour be multiplied and employed as capital, beyond the limit at which profits are diminished, so as to be on a level with the least possible maintenance of the capital.

ists. When a country is improved to the uttermost, and is, therefore, pressing on its ultimate resources, the necessities of life have become stationary in their amount; and then nothing can raise wages but a diminished population, and nothing can raise profit but a diminished capital. An increase in the necessities of life, would afford room for the enlargement of both. So long as there is fresh land to be entered upon, there is scope for the investiture of more agricultural capital; and in the larger demand of an increasing population for second necessities, as well as the larger demand of the new, and now wealthier proprietors for luxuries, there is scope for the investiture of more manufacturing capital also. While this is in progress, profit is upheld from sinking so rapidly as it would; and so the interest of money, which is proportional to profit, is higher in America, than in the old, and, at the same time, well-governed countries of Europe. But though, for a long period, agriculture may thus draw capital after it, it follows not that capital can, beyond a certain limit, force agriculture. In proportion as that limit is approached, profit falls; and capital, ever tending to an overflow, feels itself beset within the confines of a field too narrow for the advantageous occupation of it. The days have been, when the great prescription of political empiricism, for the distresses of a weak or wretched country, was an increase of population; but this has now gone by. The next remedy, at

one time embodied in the acts of government, and still proceeded on in the schemes of provincial or parish philanthropy, was the increase of employment; but this too, in ways innumerable, has proved itself to be a resource that is not indefinite. There is still an unbroken faith in the increase of capital, as a specific for the distempers of a land that labours, and is oppressed under the multitude of its suffering families. But this device too, is impotent like the rest; and we must look to some other quarter still, ere we can find the secret principle of a nation's secure and permanent well-being.*

* In the following extracts from Say's Political Economy, the reader will observe his assertion of the doctrine which we have attempted throughout this chapter to expose as erroneous —

“Neither individuals, nor communities, can extend or fertilize their territory, beyond what the nature of things permits; but they have unlimited power of enlarging their capital, and, consequently, of setting at work a larger body of industry, and thus of multiplying their products, in other words, their wealth”—Book I Chap v.

“Moreover, it may be remarked, that the powers of man, resulting from the faculty of amassing capital, are absolutely indefinable, because, there is no assignable limit to the capital he may accumulate, with the aid of time, industry, and frugality.”—Book I. Chap. xi.

In the following extract, he seems to overlook what the real distinction is, between an old and a new country, in respect of the slow accumulation of capital in the former, and its rapid accumulation in the latter, and, in overlooking this distinction, he of course must miss altogether the perception of any absolute limit, beyond which capital cannot be extended —

“In point of fact, capital is of much more rapid accumu-

CHAPTER VI.

ON THE LIMITS OF A COUNTRY'S FOREIGN TRADE,
AND ITS SUPPOSED POWER TO FURNISH A PEOPLE
WITH EMPLOYMENT AND MAINTENANCE.

I. The case of a country whose population is limited by its agricultural produce.

1. The next resource which dazzles the imagination of philanthropists and statesmen, is foreign

lation in new countries, than in countries long civilized. It would seem as if the colonists, in abandoning their native country, leave behind them part of their vicious propensities, they certainly carry with them little of that fondness for show, that costs so dear in Europe, and brings so poor a return. No qualities, but those of utility, are in estimation in the country they are going to, and consumption is limited to objects of rational desire, which is sooner satisfied than artificial wants. The towns are few and small, the life of agriculturists, which they must necessarily adopt, is, of all others, the most economical; finally, their industry is proportionally more productive, and requires a smaller capital to work upon.

“ The character of the colonial government usually accords with that of individuals, it is active in the execution of its duties, sparing of expense, and careful to avoid quarrels, thus there are few taxes, sometimes none at all, and, since the government takes little or nothing from the revenues of the subject, his ability to multiply his savings, and, consequently, to enlarge his productive capital, is very great. With very little capital to begin upon, the annual produce of the colony

trade. This is held to be a fountain-head of wealth and of employment; which, in the eyes of many, are altogether indefinite. Such is the virtue, indeed, associated with the very names of capital and commerce, that many wonder how, in a country where these have attained an unexampled magnitude, there should be any distress, and far more, ought like general distress among its families. One might understand how a people, confined within the limits of their own home trade, should be in a straitened condition. But open the

very soon exceeds its consumption. Hence the astonishingly rapid progress in its wealth and population, for human labour becomes dear in proportion to the accumulation of capital, and it is a well-known maxim, that population always increases according to the demand."—Book I. Chap. XIX.

It is pretty evident from this passage, that, in order to keep up as fast a rate of accumulation in an old as in a new country, all which Mr. Say holds to be necessary, is, that the individuals, and government of the former, should equal those of the latter, in frugality and good conduct.

We conclude this list of extracts, with a passage which depones to the fact, of the speedy restoration of a spent, or diminished capital, to its original magnitude, but indicates the prevalent misconception which obtains, as to the principle or reason of the fact:—

"It would seem that there exists in the politic, to a stronger degree than even in the natural body, a principle of vitality and elasticity, which cannot be extinguished without the most violent pressure. One cannot look into the pages of history, without being struck with the rapidity with which this principle has operated. It has nowhere been more strikingly exemplified, than in the frequent vicissitudes that our own France has experienced since the commencement of the Revolution."—Book III. Chap. vi.—See Appendix E on Profit.

world to them, and the conception is, that all straitness and limitation are necessarily put an end to. With access to all the markets of the globe, it is felt, as if every clime, and every nation, were made to contribute to our abundance; and that a horn, filled with treasure from the various regions of the earth, were thereby poured over the towns and villages of our land. The imagination is greatly confirmed, when we see the largest towns of the empire, in special connection with foreign countries, and, to all appearance, upheld by the demands and the payments of customers there. The very existence of these large and flourishing establishments, and the maintenance of their thousands, and tens of thousands, of industrious families, are ascribed to a foreign trade; the annihilation of which, would involve the annihilation, not merely of their work, but of their livelihood; and the extension of which, it is thought, would carry along with it a proportional extension of support for an unprovided, or a yet unborn population.

2. And this popular imagination receives great countenance from the representations and the views of our most distinguished economists. Home trade consists in the exchange of one set of home products for another. But over and above these, there might be commodities produced at home, for which there is no demand within the country; and for which, therefore, no equivalents can be obtained among ourselves. These Dr. Smith terms the surplus produce of the nation, the exchange

of which, for equivalents from abroad, gives rise to foreign trade. Now, he so represents it as to give the impression, that without these equivalents there would have been no surplus produce—that the former, in fact, have stimulated the production of the latter—and that, therefore, without a foreign trade, we should have wanted not merely the exportation of a surplus, but the very existence of one. He clearly accredits foreign trade with a gain to the nation, equal to the value of this surplus, which, but for the excitement of what is given in return for it, would not, he intimates, have been called into being. Had there been nothing to import, there would, according to him, have been nothing to export; and this gives currency to the notion, that neither would our present exports, nor *ought else in place of them*, have been produced. At this rate the foreign trade is a superinducement on the home, which tells in the way of a distinct addition to the wealth and resources of the country. If a million of our people be employed in the manufacture of export commodities, there is a very general imagination, and certainly an imagination which the views of our distinguished economist do not serve to correct, but to confirm, that they are employed in a business which foreign trade has called into existence, and, as their employment is the vehicle of their support, that to this foreign trade we are indebted for the support of a large proportion of our families.

3. Let us now attend, for a moment, to the real

character and effect of these interchanges in foreign trade. Let us put, for an example, the two countries of Britain and Portugal: the hardware of the one country being exported, and the wine of the other being imported; a million-worth of hardware, and a million-worth of wine. The manufacturers of hardware in Britain, become the creditors of Portugal to the extent of a million—and to the same extent do the wine-growers of Portugal become the creditors of Britain. And there is a set of debtors, as well as a set of creditors in each of the countries; the Portuguese debtors being the receivers of the hardware, and the British debtors being the receivers of the wine. The exporters in each country look to the consumers of the other as their customers; yet, in fact, neither receive payment, by a direct pecuniary remittance, from those to whom they have sold their respective commodities. The matter is adjusted in this way; and the description applies generally to the interchanges of foreign trade. The importers of hardware into Portugal pay their debt, not to the exporters of the hardware in this country; but they pay it to the exporters of wine in Portugal, and receive in return for their payment an order on the importers of wine in Britain. This order they remit to the exporters of hardware in Britain, who, on presenting it to the importers of wine, there receive payment. Generally speaking then, the adjustment takes place by bills of exchange, which have the effect of making over the debtors

in Portugal, not to their creditors in Britain, but to the creditors in Portugal; and the debtors in Britain, not to their creditors in Portugal, but to their creditors in Britain. The parties thus brought into relation, may be alike unknowing and unknown to each other; transacting, as they do, through the medium of the bill-broker, who alone comes into contact with both. Still, virtually and in effect, the export manufacturers of our hardware, receive their payment from the importers of our wine. They hold themselves to be labouring in the service, and to be maintained by the wealth, of customers abroad, but, in point of fact, they are labouring in the service, and are maintained by the wealth, of customers at home.

4. It is practically felt by commercial men, and clearly demonstrated by economical writers, that the power of exporting with advantage, is limited or measured by the power of importing with advantage; and that, when the one stops, the other must stop also. The export trade ceases to be beneficial, on the moment that the returns which come back in the exchange between ourselves and all other countries cease to be disposable. The deficiency of imports from one foreign country may be made up by an excess of imports from another; and a circuitous adjustment is then made by round-about bills of exchange. But a general deficiency of imports will lay an arrest on a farther increase of exports. In other words, we are enabled to send British commodities abroad, just be-

cause there is a demand for foreign commodities at home. The manufacturer of export articles is just as much indebted for his maintenance to our inland consumers, as the manufacturer of articles for home consumption. The only difference is, that whereas the latter works up a commodity which is immediately purchased by home consumers, the former works up a commodity which goes to the purchase of that which is immediately purchased by them. In as far as the home consumer prefers hardware to wine, he gives a price for it to the manufacturer, who in this instance works for the supply of the home market. In as far as he prefers the wine to the hardware, he gives a price for it to the wine importer, who is enabled thereby to meet the bills of the export manufacturer, who has been working for the supply of the foreign market. It is thus that the export manufacturer works, though not directly and ostensibly, yet virtually and really, in the service of the inland consumer. If not employed in the fabrication of that for which the inland consumer has demand, he is at least employed in the fabrication of that which goes in exchange for such things as the inland consumer has a value and demand for. He works up, not that which the consumers at home want, but that which will purchase what the consumers at home want. He is the instrument of obtaining for them their gratification, although that gratification comes to their door in the shape of a foreign luxury. In effect, he labours for their enjoyment, and, in effect, by them he is paid.

5. We are now able to appreciate the doctrine, that foreign trade not only provides a vent for our surplus produce, but that foreign trade called it into being. The million-worth of hardware exported to Portugal, may be denominated surplus produce ; seeing that there is no effective demand for it at home. But neither would there have been effective demand for it in Portugal, had Portugal not had the power to purchase it ; and what gives this power to her million-worth of wine, is just, that for that quantity of wine there is an effective demand, and, of course, a power to purchase it in this country. But for the million-worth of maintenance in the hands of our inland consumers, and discharged by them through the medium of the wine-merchant on the export manufacturers of hardware, to that extent would our imports have been lessened, and to that extent would our exports have been lessened also. Virtually, it is an antecedent ability on the part of inland consumers, which called this surplus produce into being. In the order of dependence, or in the order of cause and effect, the primary rank is due to the inland consumers, and the secondary or derivative, to the export manufacturers. And the plain reason is, that the manufacturers cannot do without the maintenance, but the consumers can do without the wine. Should their maintenance be destroyed by a permanent blight that would reduce the fertility of our fields, their manufacture would cease ; but should their manufacture be destroyed by some barrier of intercep-

tion that stopped both the exportation of hardware and the importation of wine, their maintenance would not, on that account, cease to be produced as liberally as before. The effect of the first catastrophe would be a permanent loss to the country, both of a certain population, and of the fruits of their industry. The whole effect of the second would be, a change of one enjoyment for another to our inland consumers; and, not a loss of people, but merely a change in the direction of their industry. We deny not the temporary inconvenience of this transition from one employment to another; but, after the transition has been effected, we should behold the same spectacle of as great and industrious a population as well employed and as well maintained as before.

6. On this subject, the history of wealth has given rise to an erroneous philosophy of wealth. We are aware that they are facts which form the materials of sound philosophy; yet a false philosophy may be constructed of facts misinterpreted and misapplied. And this we hold to have been strikingly exemplified in the case before us. It is quite true, that at the termination of the middle ages, it was mainly the presentation of luxuries from abroad, which impressed a new habit upon our landlords, and gave a new direction to their expenditure. It is quite true, that their insatiable appetite for personal enjoyment, when once excited, proved a far more powerful spur to the cultivation of their farms, than a mere desire to support or to extend

the coarse and feudal hospitality of the olden times. The love of finery and of sensual indulgence, greatly more inclined them to make the most of their estates, and to draw forth of them the uttermost of their produce, than did the love of a crowded attendance upon their persons, or of a crowded assembly in their halls. It is thus that commerce was a moving force, which speeded their transition from one habit of expenditure to another; and that it was a transition which led to a far more strenuous agriculture than heretofore. There can be no doubt that the carpets, and the looking-glasses, and the wines of other lands, gave an impulse to husbandry all over Europe; and that historically, at that time of day, the produce of foreign parts had in it a force of allurements, which not only attracted to itself a pre-existent, but gave birth to a new produce in the various countries of Christendom. But now that the transition has been made, and the modern habit of our landed proprietors has been fully established; are we to imagine, that the withdrawal of any one, or even of all foreign luxuries put together, would cause the agriculture to narrow itself within its ancient limits, or put so much as one field or furrow of land out of cultivation? Whatever the wine of Portugal may have done *then* in adding to cultivation, has it so much as a particle of influence *now* in keeping up that cultivation? Although port should, in all time coming, disappear from our markets; is there a landlord in Britain, who, on that account, would

let down the cultivation of a single acre of his property? Would he forego the hundred a year that he wont to expend on this luxury, because the luxury was no longer to be had? Would he bid his tenants remit of their wonted activity, because he had now remitted so much of their wonted rental—having no use for it, in consequence of this stoppage which had taken place in one of the outgoings of his previous expenditure? Though debarred from one of its accustomed channels, would he not find, and that most readily, new channels of expenditure, through which to impress on industry some other direction, and to discharge the same maintenance on an equal number of people in some other employment? Would he refuse an income so large as before, because, in the absence of some luxury furnished by a single branch of foreign trade, or because, in the absence of all the luxuries which foreign trade had placed within his reach, he was now at a loss for objects on which to lavish as great an expenditure as before? And besides, is there not a charm in the enlargement of income, apart from all thought of the enlargement of expenditure? Wealth, no doubt, is an abstraction, when separated from the comforts and enjoyments which it purchases. But abstraction as it is, does it not tell on human conduct with all the power of a living and substantial reality? When the offer is made of an advanced rent for land, must the proprietor calculate on the additional wine, and dress, and equipage it will afford, ere he becomes alive

to the happiness of the offer, and is led to close with it? But do we stand in any need of this argument, in the exhaustless variety of nature's gratifications, and the infinitude of resources or openings for expenditure? Amid all the failures and fluctuations which take place, whether in home or foreign trade, will not the desire of a larger revenue, and with it of a larger command over the services of others, remain an indestructible principle in his bosom? Is any conceivable obstruction in the intercourse with other countries, so to change the nature of humanity in this country, that we should no longer behold the men of it in the same attitude as before, as keen in the feeling of their interests, as insatiable in their longings and aspirations, and each on the full stretch of endeavour for bettering his own condition and his own circumstances? Landlords would just be as eager to receive a rent, and tenants as busy in their callings to pay the rent, and appropriate the largest possible surplus to themselves. In other words, many a particular trade may be destroyed, but the great and primary aliment of all trade would not be destroyed. There might be a shifting of human labour; but there would be no lessening in the amount of it. And, in the act of shifting, there might be partial and temporary distress; yet, conceding this, we should surely and speedily behold as much well-paid industry as before—and that yielded by the hands of as large a population.

7. We may thus perceive what the whole effect

would be, were our trade with Portugal suspended, or even brought to permanent extinction. Our inland proprietors would lose their wine, and our export manufacturers would lose one of their markets. But though, on the one hand, the wine should be lost, the ability to purchase it is not therefore lost. It remains entire in the hand of its old possessors, and is ready to be discharged on the purchase of some other gratification. And, on the other hand, though the market should be lost, the maintenance of those who went to prepare commodities for the market is not therefore lost. There is on the one side the spare maintenance, and on the other the unemployed population. We may be very sure that things will not continue in this state,—that, in the first place, the maintenance will not be suffered to lie waste; and, in the second place, that the population will not be suffered to lie unemployed. There will, to the proprietor, be the substitution of one enjoyment for another. There will, to the labourers, be the substitution of one employment for another. In as far as the revenue that went to be expended on the wines of Portugal goes to the purchase of foreign articles, there is just the loss of one branch of foreign trade replaced by the extension of other branches. In as far as this revenue goes to the purchase of home articles, there is just a diminution of the foreign trade, compensated by a proportional enlargement of the home trade. Ultimately, there is no one interest affected by the

change, but the interest of the consumers, who are now obliged to put up with an article which they like not so well as the one they have been forced to abandon. The very fact of their preference for Portuguese wine when they could get it, is a proof that there has been a sacrifice of taste in passing from the old luxury to the new; and so, a descent of enjoyment. This difference of enjoyment to them, is really the whole amount of the calamity which such a change can inflict upon the nation. Every other interest is comprehended in the price paid by the consumer, and which goes full fraught with all its powers and its blessings into the new direction that has now been opened up for it. It comprises as large a maintenance to the workmen. It comprises as large a profit to capitalists. And if the former luxury was taxed, and so made the vehicle of a revenue to government; this, too, enters as a constituent into the price, and the same price may still be made to comprise as large a public revenue as before.

8. We see, then, that the *terminus ad quem* of foreign trade, is consumption at home. The maintenance of all those engaged in it—the wages of the labourers—the profits of the capitalist—the tax laid on foreign articles,—these emanate not from the trade, but from the antecedent ability of consumers, who may be regarded as the real supports and fountain-heads of the trade. What is true of home, is true also of foreign trade. It should be

accredited with no more than with the commodities which it brings to the door of our inland purchasers. This it does, but it does no more than this. There is mysticism in the assertion, that a stocking-maker does aught more for the nation than simply contribute stockings; and there is just as delusive a mysticism in the assertion, that the wine trade of Portugal confers any other benefit on the nation than simply the benefit of wine, or the West India trade than sugar and coffee, or the China trade than tea. We are aware of other and far more magnificent interests being associated therewith—as the sustenance of a great population; and along with it, power, and public revenue, and national greatness. It is imagined, that, by the excision of a given branch of foreign trade, there would be an excision from the land of the means and the maintenance of all who are engaged in it; whereas, there would simply be an exchange to the consumers of one article of enjoyment for another; and to the people, the exchange of one kind of employment for another, but with as ample means and maintenance as before. The East and the West Indies are regarded as the two hands of the empire; and the imagination is, that were our connection with these destroyed, Britain would suffer as much as from the lopping off of two hands, or, in other words, would be shorn of its strength and its capacity for action, in virtue of this sore mutilation. It would positively be shorn of nothing but

its sugar and tea.* Were our intercourse with the East and the West conclusively broken up, we

* I argue on the supposition of these being their only, as they form their main commodities. When, to vindicate the importance of foreign trade, the superior worth and usefulness of its import articles are insisted on, as of timber from Norway, or nitre from the East Indies, which are important in a national view, the reasoning proceeds on a principle to which we render all homage—its subserviency to the benefit of consumers at home, being the only principle, in fact, on which we concede any value whatever to foreign trade. But this is not the only, not even the chief principle, on which our mercantile economists would rate the importance of foreign trade. They look to the interest of the sellers, and not of the buyers, although, in the price paid by the buyers, every interest of the sellers is comprehended.

And when once the real worth of foreign trade is placed on its essential and only proper foundation, there is much that can truly, and without exaggeration, be alleged in its behalf. Even its very luxuries may fulfil, to a certain extent, the part of necessities in disguise. The tea, and sugar, and wine, which come to us from abroad, supersede a very great consumption in the shape of milk, or malt liquor, or spirits, which, though not absolutely essential to subsistence, would still have been indulged in, and so have trenched on the amount of that home produce which now goes purely and nakedly to the purposes of food. Even the food itself is often imported from abroad in large quantities, but this forms a distinct case, and in our next chapter it will form the subject of a distinct consideration.

Nay, it may so happen, that, in virtue of its foreign trade, the agriculture of our land may descend farther into the inferior soils than had otherwise been possible. If any of the second necessities of life can be obtained, through its imports, with less labour, or if any of our farm implements can, by the same means, be either had cheaper, or made more effective, these would obviously tell at the extreme limit of our agriculture,

should lose the services, first of our tea-grower, and then of our tea-sweetener—for so might these

and have the effect of somewhat pushing it onward to land of greater sterility.

And in those cases where we could have had a home substitute for some foreign luxury, without trenching on the food of our population, yet, if the actual preference is for the foreign luxury, it is because we have the enjoyment we like best at a less price, or, which is tantamount to this, a greater amount of that enjoyment for the same price. But this, too, is altogether an interest wherewith the consumers, and not the producers, have to do. The producers will be equally well maintained by the consumers, in any way that the latter may choose to employ them. But it is the wisdom, and for the benefit of consumers, that they should encourage, by their demand, the foreign, rather than the home trade, when, as the result of their so doing, they obtain either a better quality, or a greater quantity of enjoyment.

Still, with all these qualifications, had our estimate of foreign trade been reduced and rectified, and set on its proper basis, governments would have as little thought of going to war for the purpose of giving laws to commerce, as of going to war for the purpose of giving laws to taste. They would have felt the matters of trade to be as much beyond their province, as the matters of fashion, and as little legislated in order to secure for us a market in other lands, as in order to arrange the dishes and wines of our entertainments, or the dresses of our ball-rooms.

The following extract from Say, is pertinent to the subject of this note —

“Although all products are necessary to the social existence of man, the necessity of food being, of all others, most urgent and unceasing, and of most frequent recurrence, objects of aliment are justly placed first in the catalogue of the means of human existence. They are not all, however, the produce of the national territorial surface, but are procurable by com-

regions be denominated. It is thus that we would reduce the importance of foreign trade to its humbler, but juster dimensions; and then assert the independence of Britain thereupon. The noble flotillas which periodically leave our shores, and return laden with the spoils of every climate, form altogether an imposing spectacle; and by which commerce has had a most bewildering glare thrown over it. But this commerce is really not a superinducement from abroad; it is the efflorescence of an inherent vigour and vitality at home. Foreign trade is not the creator of any economic interest; it is but the officiating minister of our enjoyments. Should we consent to forego these enjoyments, then, at the bidding of our will, the whole strength at present embarked in the service of procuring them, would be transferred to other services,—to the extension of home trade—to the enlargement of our national establishments—to the service of defence, or conquest, or scientific research, or Christian philanthropy. The only change would be a change of object and of end to consumers; and a change

merce, as well as by internal agriculture, and many countries contain a greater number of inhabitants than could subsist upon the produce of their land. Nay, the importation of another commodity may be equivalent to an importation of an article of food. The export of wines and brandies to the North of Europe, is almost equivalent to an export of bread, for wine and brandy, in great measure, supply the place of beer and spirits distilled from grain, and thus allow the grain, which would otherwise be employed in the preparation of beer or spirits, to be reserved for that of bread."

of employment, but not a lessening of their maintenance, to those who are now labouring in the various departments and stages of foreign trade for our gratification. It would greatly subserve the cause of peace and of enlightened policy, were this juster estimate on the subject of all trade, and more especially of foreign trade, adopted by statesmen. The great majority of wars are mercantile wars, which never might have been, but for the illusion of those great names and imaginary interests that are associated with commerce. We feel persuaded, that the fearful conflicts of other days would not now be repeated, could the nation but clearly see that the only interest for which it was called upon to fight, was a somewhat more luxurious breakfast, or a richer dye to the vestments which covered them, or an easier access to certain wines, or a more liberal importation of shawls and silks, and figs and oranges. It was never the menaced loss of one or all of these which formed the jealousy or the provocative that led to war. It was the apprehension of a far more serious disaster,—the loss of revenue to some large class of our merchants, of support to some large class of our industrious population. Had foreign trade been seen in its true character and effect, we cannot imagine that, for the preservation of a monopoly or a sugar island, so many a struggle would have been entered on. A sense of national honour may still have excited the spirit of discord among the kingdoms of the earth—but not a sense of national interest.

9. But it would appear as if no experience could unschool our politicians and patriots out of their obstinate imaginations upon this subject. In the loss of our American colonies did many a statesman anticipate the downfall of the British nation. And in spite of the utter vanity of this anticipation, do they cling with as fond tenacity to our remaining colonies as before, and would still brave in their defence the expenditure of countless millions. It is not seen how, with the unabated fertility of our own fields, and those resources, far beyond the reach of any distant influence, which lie within the circle of our own shores, we would be in possession of as ample means as before for calling forth and rewarding the services of all our population. Could this only be apprehended, statesmen would not be so tremblingly alive to the interests of any particular trade, nor would they think the prosperity of our island grounded on aught so precarious as the brittle foundation of commerce and of the seas. They would leave commerce to its own spontaneous courses; and instead of undertaking, with anxious heart and uncertain hand, as their predecessors did before them, the guidance or guardianship of its concerns, they would sleep secure in the midst of all its fluctuations. But this never has been, nor is it yet, the policy of statesmen. The doctrine of its natural insignificance is not understood by them; and both in the sigh of Napoleon's heart for ships, and colonies, and commerce, and the splendid vision of Canning, who thought he had conjured up

the resources of a new world, by which, through the conveyances of trade, to multiply without limit and without end the riches of ~~cu~~ nation, do we recognize that subtle delusion which has misled the legislators of all ages.

10. The agriculture of China is represented as now pressing on its extreme limit, yet, over and above this, Dr. Smith tells us how much richer that country would have been by the accession of foreign trade. The only effect, we imagine, of foreign trade to a country circumstanced as China is said to be, were the withdrawal of a population from the direct service of ministering to the enjoyment of their maintainers by the preparation of home articles, to the indirect service of working up export articles for the purchase of commodities in foreign lands. There would be an accession to the enjoyment of the inland consumers, seeing they preferred the product of the foreign, to that of the home manufacture. But to the people, there would only be the transference of so many hands from one employment to another, without any accession either to their numbers or to their maintenance. To whatever extent a foreign trade was superinduced, to that extent the home trade would be diminished. And, in like manner, when a new market is opened up, the imagination is, that all the business created by it is a clear accession to the country. And hence the gratulations that we hear, both in and out of parliament, when the market of South America, or the free market of the East

Indies, or any other ample and accessible field, is presented to us for the egress of British commodities. But the truth is, that an egress can only be sustained by means of an ingress; nor will exports continue to be carried out with advantage any longer than the imports which come back in return for them can be purchased at home. The only advantage of a new market is, that the wares which it offers may chance to be more agreeable to the taste and the fancy of certain of our inland consumers, than those of any other markets which previously lay open to them. In which case, there will be a transference of expenditure from old to new articles of demand—the formation of a new foreign trade, we admit, but at the expense either of the home trade, or of another foreign trade that had been formerly in existence. The extent of our foreign trade is, in fact, limited by the means, or by the extent, of human maintenance in the hands of our inland consumers. The opening of a new market can do no more for the general wealth of our country, than the setting up of a new stall can add to the wealth of customers at a fair. It may present new commodities more agreeable to the taste of purchasers, or even old commodities at a cheaper rate than before. Either of these is an undoubted advantage to customers. But it cannot add to the amount of the purchase money; so that if the new stall be at all resorted to, it must be by a partial forsaking of the old ones. The same is

true of the world at large, where each new country that is opened for commercial enterprise may add to the number and variety of our nation's markets, yet not add to the general amount of its marketing. There is thus a natural, and, for the time, an insuperable barrier in the way of the extension of foreign trade. It is necessarily limited by the wealth of the consumers at home. And hence the mockery of those splendid anticipations which dazzle the fond eye of speculators, when, either by political changes, or by the abolition of monopoly, a new country is laid open to their enterprises. The dream is speedily broken up; and in the spectacle of glutted markets, both at home and abroad, may we learn that there is a limit to the extension of foreign trade, which no country can overpass.*

11. The truth of the principles which we have laboured to expound, was put historically to the test, when, on the one hand, Bonaparte, in utter ignorance of them, thought he was levelling a death-blow at Britain, by the exclusion of our commodities from all the markets of the continent; and, on the other hand, our alarmists at home, in equal ignorance of them, trembled for the result. Neither of the parties understood wherein lay the secret of our country's strength and resources; that is, in the ability of our inland consumers to turn the manufacturers of our prohibited exports into any other direction, and in that direction to

* See Appendix, F.—On Free Trade.

support them equally well as before. The truth is, that the extinction of foreign trade in one quarter, was almost immediately followed up, either by the extension of it in another quarter, or by the extension of the home trade. The stoppage of all intercourse with France, if it should hinder the exportation of our British cloths, would equally hinder the importation of their French wines; and the price of these, paid by the inland consumers, as it supported the manufacturers engaged in the old line of commerce, would equally support them in some new line, most certain to be struck out, on the former being abandoned. Even had every outlet abroad been obstructed, then, instead of a transference from one foreign market to another, there would just be a universal reflux towards a home market, that would be extended in precise proportion, with every successive abridgment which took place in our external commerce. We never deny the consequent change that would thus take place on the enjoyment of consumers; but, along with that, we again repeat, that after this revolution in our affairs, there would survive as large a maintenance to our labourers; as large a profit to our capitalists; and the means, with perhaps some new modification of taxes, of as large a revenue to government as before. The great apprehension, indeed, connected with the non-intercourse acts of other countries, was, lest the public revenue should irreparably suffer from them; and an astonishment was felt, when, on comparing successive

years and quarters of the national income, it was found that there had been no diminution. It is in beautiful accordance with these views, that a lessening in the produce of the customs was generally followed up by an enlargement in the produce of the excise, marking the reaction of the foreign on the home expenditure; and verifying, what we might with all confidence have expected beforehand, the certainty of a full compensation, if not in respect of luxury or physical enjoyment, at least in respect of every substantial economic interest; or of all, in short, which either patriot or philanthropist needs to care for.

12. It is not our province minutely to explain the variations of what has been called, the rate of exchange between two countries, or the causes on which they are dependent. But it is a truth, theoretically understood by economists, and experimentally felt by practical men, that the mutual imports and exports which pass and repass, cannot exceed a certain disproportion; that they must so reciprocate as to be nearly of equal value, the one to the other; or, at least, that there is a certain difference or excess of the one over the other, which neither of them can pass. The possible amount of exports is limited by the possible amount of imports, and conversely; and this is distinctly and numerically indicated by the state of the exchange. If there be a certain point at which the import trade ceases to be profitable, that determines the point at which the export

trade ceases to be profitable. When there is a deficiency of imports, this produces a state of the exchange unfavourable to the export merchant, and which goes in deduction from his profit, so that should he enlarge his exports any farther, the profit might cease to be a remunerating one. In other words, his power to export is limited by the power to import; and this latter power is evidently limited by the ability to purchase on the part of our inland consumers. It is therefore in vain to talk of the indefinite demand for our commodities on the part of other nations. This will avail us nothing for the extension of our trade, unless it be followed by an indefinite power on the part of our inland consumers, to purchase the commodities which come back to us in return. It is conceivable, that there might be a demand in a foreign country, and, but for the obstacle we now insist upon, effective demand too, for British exports; the preparation of which would require the industry of a million of people, over and above the numbers already subsisted by the agricultural produce of the island. And, could the agriculture be so enlarged as to afford this additional subsistence, there would be no difficulty in meeting this demand from abroad. For the larger imports necessary to meet the now larger exports, could then all be absorbed. Let the maintenance be stretched out to the support of an additional million of human beings, and the wealth of the holders of this maintenance is thereby

stretched out to a capacity for purchasing, either the immediate products of their industry, or the equivalents given in exchange for these products. The additional maintenance given in return for the new imports, goes to the support of the people who labour in preparing the new or additional exports. It is thus that, with every stretch in the agriculture of a country, there is room for a corresponding stretch in its foreign trade. But should the population of that country have access to no other agricultural produce than that which is raised within its own territory, then, with the difficulty or the impossibility of extending the agriculture, will there be found a like difficulty or impossibility of extending its foreign trade. It is by an exchange adverse to him that the export merchant is brought to the test and the feeling of this difficulty. It is when imports cannot find a sale, because there is not wealth in the country to purchase them, that foreign trade meets with obstructions to its increase. It is then that the tendency to an excess is counteracted by the heavy diminution which profit suffers, from an unfavourable exchange. The limit, in fact, of our agriculture, is also the limit of our commerce; and so again, do we find the margin of cultivation to be a place in the science of political economy, whence another of its important lessons may be drawn.

13. This subject admits of some weighty and important applications. First, there is a fortunate coincidence between the tendency to excess of B11-

tain's export manufacturers, and the tendency of British gentlemen to reside and travel in foreign parts. It will be seen, on consideration, how the expenses of our landed gentlemen abroad give an impulse, because they give a real advantage to the business of our export manufacturers at home. They tell favourably for that business on the rate of exchange. Had the non-residents of Britain spent their incomes at home, it must have been chiefly in the purchase of home, and but fractionally in the purchase of foreign commodities. Only a small proportion of their revenue would have been appropriated to the purchase of returns from abroad, and, with this limitation on the imports, there behoved to be a corresponding limitation on the exports also. But when, instead of this, they take up their residence, or are much personally in foreign countries, their whole, or at least the far greater part of their expenditure, must be given to foreign produce; and this, in as far as the effect on exchange is concerned, is precisely tantamount to a larger importation of produce into Britain. The export merchants of this country have the same benefit from the residence of British landlords abroad, that they would have had from the importation of all which they consume abroad. The growth of a taste for foreign travelling, or foreign sojourning, has the same favourable effect on their interest, as the growth of a taste for foreign articles of expense among the gentry who never go from home.

It matters not whether the *British consumption* of foreign produce takes place within our country or out of it. In either case, the price is paid by Britons, and is equally set over and against the price paid by foreigners for our export articles. The sum paid by Britons for articles raised abroad, is, in truth, the great fund out of which those merchants and manufacturers are paid, who carry abroad the articles which are raised at home. If this sum be any how enlarged, then, proportionally to it, will the amount or the profit of our export trade be enlarged. The only difference is, that our export manufacturers, instead of working in the service of British consumers at home, work in the service of British consumers, who have chosen to transport their persons and their expenditures abroad. In the one case they are paid by bills on our merchant importers. In the other case, they are paid by bills on the agents of our absentee proprietors; and an abundance of bills on either of these classes is alike favourable to the business of exportation. If British landlords, to the extent of a million of rental, have chosen to take up their residence in France, and a million worth of British goods be annually exported there, the adjustment can take place as effectually by bills, as if our landlords had staid at home, and there had been the importation of a million worth of French goods into Britain. The British exporters are paid by bills on the rent collectors of the British absentees. Or, the British landlords have their rents remitted

to them by bills on the receivers of British exports in France. There may have been no agricultural produce exported from Britain for the payment of this rent. The full value of it may have been exported in British manufactures; in which case, both the capitalists and the workmen of this country are as effectually maintained by the ability of our non-resident landlords, as if these had been living on their own estates, and spending their revenues within the country. This non-residence may not have lessened the amount of British industry. It might only affect the direction of that industry. Instead of working in the service of landlords at home, by preparing articles which partly would have been bought by them, and partly been exchanged for imports to be bought by them; there are so many of our population employed in the service of these same landlords abroad, by preparing articles to the full value of their rent, and making an entire exportation of them. The receivers of these articles in France pay the price of them to the British residents there, and thus these obtain their rents. The preparers of these articles can, by means of orders from the British absentees on their agents, or tenantry, draw from the rent which they owe; and thus these obtain their remuneration. In the whole of this process, there need not be the transportation of any food from Britain to France, even though they are the proprietors of Britain's food who are there spending their incomes. The whole of that food may go to

the support of British industry notwithstanding; and, in spite of denounced and deprecated absenteeism, may there be a population in the midst of us, fully commensurate to the maintenance that we raise, and maintained too in as great fulness as if the great and wealthy of our land never strayed beyond its borders.

14. There is much that we cannot demonstrate at full length, which, nevertheless, we might venture, with all safety and confidence, to affirm. The superiority of our exports to our imports is connected with peculiar facilities, and tends also to cheapen both the travels and the residence of our countrymen in foreign parts. A gentleman of England, in any foreign country, will find it possible to negotiate his orders on home, both with greater ease and economy, than one having the same territorial wealth in Poland. Wherever he goes, he meets with the debtors of his own nation, who would prefer a bill from him, for the settlement of their accounts, to the expense and hazard of a pecuniary remittance. It is thus that he may get a premium for his bill, when the traveller of another kingdom would need to offer such a premium, ere he could obtain the conversion of his order into money. The exports of England may be regarded as the instruments by which she can obtain accommodation and service for her sons in any quarter of the world whither she might send them. The deficiency of return imports to England, is made up by the demand and the wants

of Englishmen on the spot. What they purchase there, comes in lieu of imports. And so long as their expenditure abroad does not exceed in value the superiority of our *manufactured exports* over our imports, we hold that the non-residence of proprietors may be carried to any extent, without the infliction of any *economic* evil upon the nation.

15. But when a country, instead of exporting manufactures, exports agricultural produce, the economical effect of absenteeism ought to be stated differently. The non-resident landlords of England have their rents sent after them; not in the produce of their estates, but in the workmanship of a people who remain at home, and are fed by that produce. But the absentees of Ireland are paid, not in the work of Irish labourers, but in the food of labourers. The effect of their non-residence is to carry off, not the ultimate products of industry, but its maintenance—not the food transmuted into the handiwork of those who are sustained by it, but the food itself,—to the positive lessening therefore of the means by which a population are supported. Should the absentees of England be recalled, it might add nothing to the maintenance, but only affect the direction of labour. But should the absentees of Ireland be recalled, the maintenance of thousands, now sent off in annual shipments, would be retained within its territory. This is another resource in prospect and reserve for that interesting country, when, in the further development of moral causes, it shall have

become the congenial home of its own proprietors. This single change in their habit, would as effectually augment the produce applicable to the subsistence of Irishmen, as a better cultivation would : another proof, that however overpeopled in reference to its present condition, the physical and economic capabilities of the land are adequate to the liberal subsistence of a much larger population.

16. But there is another application still more interesting. Connected with the facilities which belong to England, for the manufacture of valuable exports, she has not only the power, beyond other countries, of commanding personal services abroad to Englishmen individually, but she has also the same superiority of power, for commanding public and political services to the state nationally. Food, speaking generally, is far more bulky and uncarriageable than workmanship ; and, when we come to certain of the finer and lighter fabrics, we shall find, that within the limits of one vessel, a hundred-fold greater value may be comprised in the products of human industry, than in the articles which serve for the maintenance of human industry. It would require, for example, an enormously greater expense to transport into the heart of France, a given value of agricultural produce from Poland, than to find way into Austria for the same value of muslins, or of precious hardware from Britain. It is thus that we are enabled, by the mere conveyance of our manufactures, to obtain a claim or right of command, over the pro-

perty and services of a country in some distant part of the world. Instead of taking back in imports the value that we have exported, we may transfer it by loan to the government of the country; we may agree to subsidize its sovereign, and make good our contract by granting him bills on the receivers of our exports there, who are his own subjects; we may, by the same expedient, command the maintenance of our own armies in foreign parts, or we may pay for the services of mercenary troops. It is thus that, in fact, we have intermeddled with all sorts of distant politics, and have the means of doing so influentially. Even though Russia had equal wealth with Britain, so that the whole products of the one nation, if brought to the same market, would fully exchange with the whole products of the other, yet the wealth of the former is not so transportable as that of the latter. Russia and Britain have both great ascendancy in Europe, but the forces by which they can assert it, are put forth in a different way. The former country, though not so densely peopled, yet, in virtue of its prodigious extent, may be said to abound in men, and in the sustenance of men. She can collect an overwhelming host from her provinces; and either send along with her armies the materials of their maintenance, or find, by plunder, these materials in the countries through which they pass. It is thus that her ascendancy is made good by a ponderous locomotion; whereas that of Britain may be upheld in the midst of

peaceful and civic pursuits, and without the departure of a single soldier from her shores. Instead of sending soldiers abroad, she can hire and employ them in foreign parts, by the labour of her artisans at home. With the products of that labour, she can purchase the aid of foreign troops, or the co-operation of foreign governments in her schemes. It is this which has given her a mastery in the negotiations of European policy; and she has made ample use of the powerful and peculiar weapons that her carriageable exports have put into her hands; carriageable, both from her position in the waters of the sea, and from the nature of the exports themselves. * It is interesting thus to connect the politics with the economics of Britain, and trace her influence in other lands, to the simple circumstance of her being able, by manufactures, to comprise much value in little room, of her dealing in such light and transportable wares. Dr. Smith, and others, had long remarked the impulse which a foreign war gave to our exports. It is because our expenses abroad just serve the very purpose of importation from abroad. Government pays our export merchants, by purchasing their bills on their foreign correspondents; and, in making over these bills to commissioners, or subsidized governments abroad, they put their schemes of warfare into action. The demand for these bills gives a mighty benefit and enlargement to the business of exportation; so that, connected with our great public expenditure on foreign objects, there

is a glowing industry in our manufacturing districts and great commercial out-ports.

17. And here we feel tempted to remark on the egregious delusion of that most mercantile of all our politicians, who founded every calculation of Britain's strength and Britain's glory on the prosperity of her trade; and verified the maxim of ignorance being the mother of devotion, in the idolatry which he rendered to commerce, whilst all unintelligent and unknowing of its internal mechanism—we mean the late Mr. Pitt. Year after year did he lull the British parliament into mischievous security, by the oft-repeated tale of the superiority of British exports. It never once occurred, that a foreign subsidy, or loan, would of itself create that superiority. If we contract for twenty millions to Austria, it is only by the difference between our exports and imports that the contract can be made good. Had there been no loan, there would have been no such excess to boast of; as the whole payment for what had been sent abroad, would then have been made to us in the return of commodities sent back again. But there were no such returns, just because the whole of this vaunted superiority in our exports had been absorbed in our foreign expenses. The phenomenon of a perpetual superiority in our exports, is explained by the perpetual yearly expense of our foreign establishments, as at Gibraltar, and the Greek Islands, and South Africa, and New Holland, and the other colonial dependencies of Britain in various parts of the world.

And the phenomenon of that prodigious superiority in our exports, which ministered such complacency and triumph to the mind of Mr. Pitt, was just the enormous addition which he made to this expense by his foreign subsidies and wais. We cannot imagine a more complete specimen of inverted mental vision, than was given on these occasions—when the country was bidden to rejoice during the heavy additions that were making to the mortgage of the state; and to read, in the necessary effects of this expenditure on the balance of trade, the symptoms of our national prosperity and greatness.

18. And whatever it is that we want done in any foreign region, the exportation of British goods to that region, or to its vicinity, facilitates or furnishes a mean for the doing of it. This holds true, let the business be what it may that we wish to have executed—whether the business of war, or the business of Christian philanthropy. The very circumstances which have invested Britain with such effectiveness in the political contests of far distant territories, mark her out as pre-eminently qualified, among the nations, for the glorious contest with human infidelity and vice all the world over. We have only to look intelligently at the process, and it will disarm the vulgar complaint, that by supporting missionaries abroad we send money out of the country, and so impoverish our own people. If I indulge in the use of foreign luxuries, when they are brought to the country they behave to be paid for; and they are paid by our exports. Sup-

pose me to abandon this gratification altogether, and that I transfer the expense of it to the support of a missionary enterprise. To myself there is a change—the substitution of an exalted moral, in place of a physical enjoyment. To the country there is no change, at least no such economic change as ought to be deprecated. The people who prepared the exports, that went to pay the foreign luxuries which I used at home, may still prepare the same amount of exports to pay the expenses of the missionary whom I support abroad. It is thus that the agents of our apostolical benevolence and zeal may depart in thousands from our shores, and be upheld by us in the whole cost of their expedition and their doings, and yet may we retain a population as great as the agriculture of the island can subsist, and keep them in the same comfort and well-paid industry as before. The peculiar advantages of Britain enable her to do this without the transportation of any food; and simply by the transportation of her manufactures, through the medium of which, she can, without sustaining any economic injury whatever, send remittances, to an inconceivable amount, for the support and equipment of her missionaries. Instead of impairing, it would, in certain directions, give an impulse and extension to our trade; while to ourselves, the contributors, there would be but the exchange of a sensible for a spiritual gratification—the giving up, it may be, of foreign luxuries, for the higher luxury of foreign benevolence. We

as effectually support our export manufacturers in the one way as in the other ; and though still, the expense of her missionaries forms too insignificant a proportion of British wealth to be admitted into the reasonings of economic science, yet the time may come, when our nation shall exchange her glory in politics and war, for a nobler and more enduring glory, and be the prime instrument of that splendid prediction, that many shall run to and fro upon the earth, and knowledge shall be increased.

19. On the whole, then, it is obvious that foreign trade will always, or very nearly, maintain itself up to that point which is desirable in the given circumstances of a country ; and this without the anxious or artificial fostering of any national policy. Foreign, like home trade, is only to be accredited with the service of furnishing to consumers its own articles of enjoyment ; and not with the maintenance of those who are engaged in it. When two countries enter into mutual trade, the common idea is, that each stands indebted to its customers in the other, for the maintenance of its foreign-trade population, just as a shopkeeper is maintained by his customers ; and the enjoyment which each has in the use of the other's commodities, is regarded but as a subordinate advantage, as being a thing more of individual gratification, than of national importance. Now the real state of the matter is, that each stands indebted to the other, only for the enjoyment which it has in the use of the other's

commodities ; but that, save where there is a transportation of agricultural produce, each maintains its own foreign-trade, as effectually as it does its own home-trade population. This view would reduce the natural importance of foreign trade, and so reduce the alarm that is felt in the prospect of its fluctuations or its failures. The simple consideration, that they are the consumers at home who maintain the manufacturers of the articles sent abroad, should keep us easy under all the casualties to which foreign trade is liable. The threatened loss of their subsistence to hundreds of thousands of families might well make us fearful ; but the threatened loss of oranges, or dye-stuffs, or tobacco, or even of sugar, wine, rum, tea, tamarinds, nutmegs, mahogany, and coffee, ought not to make us fearful. We might feel annoyed by the loss, or rather the change, of our personal enjoyments. But there are many things which annoy that should not alarm ; and when such magnificent objects as political greatness, and national security, and the sustenance of many thousands of industrious workmen in the cities and manufacturing districts of our land, and the revenues of the state, and the consequent support of our establishments, whether civil or military—we may rest assured of a delusive imagination, when these come to be associated with that trade, which but supplies us with foreign luxuries, and does no more. The destruction of our intercourse with any foreign land, between which and ourselves a prosperous and satisfactory trade

may now be going on, will but stop an outlet for our commodities, and an inlet for theirs; but will not destroy the maintenance which, through a process already explained, now passes from the consumers of our imports to the manufacturers of our exports. It will influence the direction of our industry, but not the amount of it; and leave to the industrious as good a wage and as liberal a maintenance as before.

20. But like every other economic interest, by which it is vainly attempted to provide indefinitely for an indefinitely augmenting population, foreign trade, too, has its impassable limit, beyond which it cannot be carried. In most countries, it may be said to repose wholly on an agricultural basis; and in no country of any great extent, can it be made far to overlap the limits of the maintenance raised at home. The imports and the exports mutually limit and determine each other; and, generally speaking, whatever foreign trade a country can support, it is not in virtue of an originating force from without, but in virtue of an inherent ability that resides and has its origin within the territory. If export manufacturers do prosper in any country, it, in the vast majority of cases, is owing to the power of maintaining them in the hands of inland consumers. Wanting this, to uphold a foreign trade, there would behave to be a process of exportation, without a counterpart importation; a process which economists can demonstrate by reasoning, and which merchants feel in experience to

be impracticable. And the simple reason why foreign trade generally stops at the point, when, if extended further, there would need a larger manufacturing population than the agricultural produce of the country can subsist, is, that agricultural produce is of such expensive transportation. But the further development of this peculiarity we postpone to our next chapter.

CHAPTER VII.

ON THE LIMITS OF A COUNTRY'S FOREIGN TRADE,
AND ITS SUPPOSED POWER TO FURNISH A PEOPLE
WITH EMPLOYMENT AND MAINTENANCE.

II. *The case of a country which imports agricultural produce.*

1. IT must be at once obvious, how much more carriageable the products of manufacturing industry generally are, than the agricultural produce is, which forms the chief maintenance of that industry. This, of itself, causes a great saving; when, instead of sending forth the food which maintains the workmen, or the raw materials which form the substratum of any manufacture, we can, in return for our imports, send the finished and wrought commodity itself. There can sometimes a hundred-fold greater value be compressed within the same space, in a finer article of manufacture, than would be occupied by the food which went to the subsistence of the labourers employed in it. Unless the food, then, be relatively in greater abundance, or the country labours under some peculiar disadvantage for manufactures, it is for its profit to send forth the workmanship of human hands, rather than the subsistence of workmen;

seeing that one cargo of the former is often of greater value than twenty of the latter. It is thus that the same value can be transported at less expense, or, which is tantamount to this, a greater value of commodities at the same expense can be landed in a foreign market, in the former shape, than in the latter; and can there command a greater return of commodities to be sent back as imports. The export merchant finds that he can bring goods cheaper to a foreign market in the one way than in the other; or, with the same cost to himself, can there dispose of articles which bring him larger equivalents; and the country also finds, that, in this way, it obtains a larger return in foreign articles of use or luxury, and so at the same expense can command a larger amount of enjoyments.

2. But more than this; there may be such facilities for manufacture, as to put a country in the condition of having to import its agricultural produce. It may so abound in the best materials; or it may possess such a quantity of coal, that great impellent of machinery; or it may be the seat of so many mechanical inventions, each, so long as it is undivulged, conferring a monopoly on the possessor of the secret; or it may be so distinguished by the industrious habits of its people; or, lastly, it may have such superiority over other nations in respect of geographical position, and also in respect to the extent of its sea coast, and so its easy and convenient access to distant places; that, with the benefit of these various facilities, it may be

enabled to work up many a goodly fabrication, and many a desirable commodity, far cheaper than can be done in any other region on the face of the earth. It is thus that the products of its industry may become the objects of a very general demand throughout the world. In these circumstances, the export manufactures which are carried abroad, may soon be equal in value to the imports which are used at home. They will even tend to exceed this value; in which case, should there be any barrier, whether natural or artificial, against the importation of agricultural produce, the superiority of exports over imports will tell unfavourably on the state of exchanges for any further exportation, which will thus be limited by the difficulty of finding disposable returns.

3. Now this is the very state in which, on the non-existence, or the removal of such a barrier, agricultural produce will flow into a country from abroad; seeing that its importation, notwithstanding the heavy expense attending it, may, to a certain extent, be profitable, and therefore practicable. If, by its advantages for manufacturing, a country can work off commodities cheaper than its neighbours, it may be so much cheaper as to counter-vail the expense attendant on the importation of food. To meet the general demand for our better and cheaper manufactures, may require the services of a population over and above what our own agricultural produce can maintain. For the maintenance of this extra population an extra produce

must be fetched from abroad, subject of course to the charges of its conveyance. But as there cannot be two prices for an article of the same quality, the home and the foreign grain, if equally good, will be disposed of in the market upon equal terms. The same necessity which caused the importation, must have raised the nominal value of our own agricultural produce. The necessities of life will have become dearer than they would have been in other circumstances, but connected, as this is, with an additional demand for workmen, labourers will not on that account let down their standard of enjoyment; and so manufacturers will have to lift up the money-price of labour. It is thus that the peculiar advantages of a country for export manufactures, are met by a counteractive disadvantage, which will at length limit the amount of exportation. But so long as the cheapness of our manufactured goods, arising from the greater productiveness of British labour, compensates, or more than compensates for their dearth, arising from the more expensive maintenance of British labourers; the extra demand for our commodities will be upheld or extended; and along with it the importation of food from distant lands. A population will be formed in our territory over and above what the territory itself can maintain. For the sake of distinction, we shall estimate the *natural population* of our island by the number of human beings within it, actually subsisted on the produce of its soil, and whatever the excess of our whole

population beyond this may be, we should term the *excrecent*, or the superinduced population.

4. Those export manufactures then, the labourers in which belong to the natural population, are exchanged for foreign manufactures or foreign luxuries.* Those export manufactures, which are wrought up by the excrecent population, are exchanged for the agricultural produce of foreign countries; on which countries, then, we so far depend for the first necessities of life, the means and the materials of human subsistence.

5. This excrecent population will not accumulate in a country beyond a certain limit. In the first place, along with every extension of it there must be an increased importation of food, which will therefore have to be fetched from greater, or more impracticable distances than before. The sea-coasts, or river-sides of an exporting country, will only supply a given demand for corn;† and should the demand exceed this, the additional supplies must be drawn from the interior, and the heavy expense of land-carriage added to the expenses of navigation. It is thus that, with every accession to our excrecent population, there must

* Foreign manufactures are not always foreign luxuries.— See Note, Chap. vi. Sect. 8.

† See Jacob's Report to the House of Lords on the Corn Trade. A land-carriage of twenty-four miles adds the expense of $13\frac{1}{2}$ per cent. to the original price of the grain, from which it may be seen how soon, by having to fetch it from greater distances, the process of deriving supplies from abroad behaved to be terminated.

be an accession to the price of grain, and so to the money-price of labour—a process which must stop, whenever the disadvantage to which a manufacturer is liable in the high wages of his workmen, exceeds the advantage which he has in the facilities of his British situation; for at that point will he begin to be undersold, and so shut out from any further enlargement of his business by the competition of foreigners. But secondly, with every addition to the excrescent population, there must be an enlarged exportation of British goods, which will become cheaper in foreign markets in proportion to their supply. These two causes act together in powerful co-operation; so that between the increasing dearness of their maintenance at home, and the increasing cheapness of their manufactures abroad, an arrest must at length be laid on the increase of an excrescent population. Add to this the constant approaches to equalization, between different countries in industry and the arts of life. Britain cannot for ever perpetuate the monopoly which is grounded on the secrets of her superior skill, or on the superior habits of her population. Other countries must at length come nearer to us, both in respect of their machinery and of their men, so as to supply themselves, and likewise their neighbours, with many of our commodities cheaper than we can. It is because the workmanship of human hands is so much more transportable than the sustenance of human bodies, that the interchanges of commerce lie far more in manufactured

goods than in agricultural produce. The bulkiness of food forms one of those forces in the economic machine, which tends to equalize the population of every land with the products of its own agriculture. It does not restrain disproportion and excess in all cases; but in every large state it will be found, that wherever an excess obtains, it forms but a very small fraction of the whole population.

6. It is all important, then, in our reasonings upon this subject, that we advert to the distinction between the two sorts of foreign trade—that for which the returns are made in the manufactures or luxuries of foreign nations, and that for which the returns are made in agricultural produce. Each trade must have an agricultural basis to rest upon; for in every process of industry, the first and greatest necessity is that the workmen shall be fed. But it makes the utmost practical difference between these two, that the former rests on the basis of a home, and the latter on the basis of a foreign agriculture. In most cases, and more particularly where it is a nation of extensive territory, the whole of their foreign trade is of the first description—the home population engaged in it subsisting exclusively on home produce. When, over and above this, there is an excess of population that requires foreign produce for its subsistence, it will be found, in larger states more especially, that it forms but a small fractional part of the whole. In other words, generally speaking, the excrescent bears a very minute proportion to the natural po-

pulation of a country; and almost nowhere does the commerce of a nation overlap, but by a very little way, the basis of its own agriculture.

7. By keeping this distinction in view, we shall better estimate the precise character and effect of that calamity, which either the suspension or the loss of foreign trade inflicts upon a nation. In as far as foreign trade rests on the basis of a home agriculture, the trade may be destroyed—yet, on that basis all the people employed in it will continue to be upholden. The export manufacturers will be discarded, no doubt, from their present occupations; yet, supported as they were formerly by a maintenance in the hands of our inland consumers, by that maintenance they will be supported still, only in return for a new service. As we have often said already, there will ultimately be no loss to them, and but the loss of some enjoyment to their virtual maintainers; or rather, the loss of any difference, if there be a difference of superiority, which the old enjoyment had over the new one. It would greatly mitigate our fears of a calamity, and at least take away all sense of its national importance, could we but perceive of foreign trade, that its destruction involved in it no other suffering than this—that is, a certain disappointment to the taste or fancy of consumers; but leaving withal, the same amount of well-paid industry in the land, as sufficient a maintenance as before for as large a population. It is different when the foreign trade rests, either in whole or in part, on

the basis of a foreign agriculture. There is no disruption between the people and their maintenance, by the extinction of the one trade—there is, by the extinction of the other. Let an end be put to the first, and our export workmen will still find footing, in some new capacity, on the soil that sustains them—where, in the midst of home resources, they will be sure of a harbour and a landing-place. If an end be put to the second, it will be tantamount to a sentence of decimation on the families of the land—a sentence which exile or famine will carry into effect. The destruction of foreign trade, in a country which subsists itself, may abridge the enjoyments of the community; but it will neither abridge the population, nor the industry of the population, though it changes the direction and the products of that industry. The destruction of foreign trade in a country which has to import agricultural produce, would cancel from the land an integral part of its population and its industry. To depend in part on other countries for enjoyment, is but a slight matter, when compared with depending on other countries for our existence. The effect of a disruption, in the one case, is not to be compared, in point of vast and fearful importance, with the effect of a disruption in the other. Yet from want of a right discrimination, the two are blended and confounded into one. Politicians look with misplaced and exaggerated alarm to the loss of foreign trade in the general—to the loss of all or any foreign trade. The bugbear and the reality

are both viewed with one common feeling ; and an event which involves but the disappointment of families in respect of luxurious indulgence, is regarded with the same apprehension, as if it endangered the stability or very being of the nation.

8. When the excrescent bears a great proportion to the natural population, as it sometimes does in smaller states, and more especially in independent cities—then, when their commerce abandons them, their all, or nearly their all, abandons them. They sustain a mutilation by every abridgment of their foreign trade, seeing that the returns are chiefly made in the first necessities of life ; and that with the disappearance, therefore, of such a commerce, so much of their population and their industry must disappear along with it. In ordinary cases, the discarded population are thrown back on the agricultural basis, which upheld them before, and which is broad enough, and solid enough, to uphold them still. But in this case, a population, dissevered from their maintenance, are thrown adrift on the wide world ; and, with their dispersion, there is a corresponding decline of national strength and national greatness. There is all the difference in the world between that commerce, the annihilation of which would but involve the loss, or rather the change, of luxuries, and that commerce, the annihilation of which would involve the loss of the first necessities of existence. In the latter circumstances of a country, we are not to wonder at the commercial jealousies which have

actuated its governments. To be undersold by neighbours, were to them a death-warrant, involving, as it does, their exclusion from those markets whence they fetch the very aliment of their being. This accounts well for the fragility and the precarious existence of all such states—of Tyre, and Carthage, and Venice, and the Hanseatic towns of Germany, which pass before us in splendid, but ephemeral succession, as we contemplate the history of past ages. When deserted by their trade, the very foundation on which they rested gave way under them, they having no such foundation in any territory of their own. They, in fact, became as helpless as any inland town of home shops or manufactures, when deserted by its country customers. This is enough to account for the speed and splendour of many a mushroom elevation—for the speed of many a helpless and unrecoverable fall—for the decay of commerce in smaller states—and the utter destruction of its isolated cities. Hence the desolation of Tyre, and hence the departed glory from the north of Italy.

9. Now they are such histories as these, which have inspired many of our compatriots with the same feeling of insecurity for Britain. We have a splendid commerce, which somewhat overlaps the basis of our agriculture, and, of consequence, a certain amount of excrecent population, and that probably would be enlarged, in some degree, were the present restrictions on the coin trade wholly done away. Yet it is consolatory to un-

derstand, that, in our years of greatest scarcity, when all our ports were thrown open, and the utmost encouragement was given to the trade, the importation scarcely exceeded one-tenth of the annual importation of the island; and that the average importation of ordinary years would not serve our population for eleven days.* We should not imagine our present excrescent population to be so much as a thirtieth part of the whole; nor do we believe that, on the removal of all fetters from our trade, we should permanently superinduce upon the country an addition of one-tenth to that population who are subsisted by the produce of our own agriculture. The circumstance of having any excrescent population at all, exposes us certainly to an inconvenience on the interruption of our commerce, which should not otherwise be felt. Yet, whatever that inconvenience might be, it is our confident persuasion that Britain would weather it. That a deficiency, by one-tenth of the usual supply in the first necessaries of life, would be seriously felt is very certain; and the price would be enhanced much beyond the proportion of this defi-

* Colonel Torrens, in his able Essay on the External Corn Trade, urges this argument with great effect against the alarmists. He quotes the authority of Mr. Jacob for the importation during the years of greatest scarcity being considerably less than it is stated in the text,^a—namely, that—if the one be correct in his calculation, and the other in his quotation—the importations of 1800 and 1801, taken together, did not amount to five weeks' consumption, or to little more than two weeks' consumption for each year.

ciency. Yet we believe that the country would experience a speedy, an almost elastic recovery from the evils of such a visitation. The very dear-ness of an article impels to a thousand shifts and expedients for economizing it. The people would, for a season, put up with fewer of the second necessities; and this, of itself, would have the effect of at once extending the husbandry to poorer soils, and transferring so many of the secondary into the agricultural population. There behoved to be an increase of food, from the additional stretch thus given to the cultivation; and there might be a greater increase still, from the lessened consumption both of animal food and spirits, and from the stoppage of distilleries by an act of the legislature. With these compensations in our power, we have little to fear, even though the violent improbability, "*Britannos toto cælo divisos*," were to be realized. We should remain as independent, as stable, and as great a nation notwithstanding. Let commercial failures and commercial fluctuations be what they may, they can never liken our history to that of the Venetian States, or the Hanseatic cities. The maxim, "*Carthago est delenda*," is not applicable to us; and, though lifted in menace by a whole continent, would fall powerless upon our shores. Our commerce, after all, is mainly but the efflorescence of our agriculture; and though lopped off by the hand of violence, it would leave untouched the strength and stamina of the nation. Could we only brook the loss of our foreign luxuries, we

might have a means and a maintenance at home for all our population, whom we could employ in the preparation of other luxuries; or with whom, enlisted in the service of patriotism, we might raise a wall of fire around our island, and brave the hostility of the world.

10. This distinction between the natural and the excrescent trade of Britain, when it comes to be understood, will hush the inquietude of our present alarmists. The one is based on a maintenance produced at home, the other on a maintenance imported from abroad. The export manufacturers belonging to the former are a disposable population, labouring in the service, and subsisted by the wealth, of inland consumers. The export manufacturers belonging to the latter, both labour in the service, and are subsisted by the wealth, of foreign customers. They are a disposable population too, but at the disposal of landlords at a distance, instead of landlords at home; of men who, in changing the direction of their expenditure, would desert them altogether, instead of men whose change of expenditure would but transfer them to a new service: That is altogether a false analogy, by which Britain is likened to those states of ephemeral glory, whose greatness and power but lasted with their commerce. Our excrescent population and trade bear no such proportion to our natural, as theirs did. Should a disruption take place between ourselves and foreign countries, the excrescent, with us, would speedily be absorbed in the natural. When

Venice was separated from her customers, the foundation on which she mainly rested gave way under her. Our foundation is our own territory. Though separated from our customers, we are not therefore separated from the maintenance of our population. There would be a change undoubtedly—a change of pursuits to the working, and of enjoyments to the wealthier classes of our community. But, with this exception, it would be as great and flourishing a community as before—as competent to all the purposes of defence and national independence; and, though shorn of her commerce and colonies, though bereft of these showy appendages, as available, and we think more so, for all the dearest objects of patriotism.

11. This view, we think, should serve to moderate our commercial ambition, and to quiet one of our great commercial jealousies. So long as Britain can pay cheaper for her imports, by the exportation of manufactured commodities, which are in effective demand abroad, she will never need to export agricultural produce; and so, to alienate from her shores the materials of human subsistence, wherewith to purchase foreign articles of any kind for her consumers at home. Her peculiar facilities for manufacture, will always secure for her this independence; and her only danger is, lest her overpassing facilities shall make her independence a precarious one, by landing her in an ex-crescent population. In which case, the only effect of being undersold by her neighbours, is the abridg-

ment of this excrescent population. What a mockery does this lay on the fears of our mercantile statesmen, and on the whole system of their policy. Their great dread is that of being undersold by foreigners; while yet the chief effect of the commercial superiority they are so anxious to preserve, is just to enlarge the sale of British exports beyond the possibility of their being paid for, either by the luxuries, or the other goods not agricultural, that come in return for them from other lands. In which case, there is a surplus of exports that must be paid for in agricultural produce. The population is thereby enlarged, beyond the power of the country to feed them from her own stores; or, which is the same thing, the trade is enlarged beyond the limits of her own agricultural basis. There are additions made by this to the weight or dimensions of the superstructure; but without addition either to the strength or amplitude of the foundation. The only effect is to foster an excrescence, which, if not mortal to us as to other commercial states, is just because, with the uttermost of our false and foolish ambition, we cannot overstretch the foreign trade so far as they did, beyond the limits of the home agriculture. By thus seeking to enlarge our pedestal, we make it greatly more tottering and precarious than before; for, like the feet of Nebuchadnezzar's image, it is composed of different materials, partly of clay and partly of iron. The fabric bulges, as it were, into greater dimensions than before, but while its na-

tive and original foundation is of rock, the projecting parts are propped upon quicksand ; for the sake of lodging a few additional inmates in which, we would lay the pain of a felt insecurity, if not an actual hazard, upon all the family. We rejoice in the luxuriance of a rank and unwholesome overgrowth ; and, mistaking bulk for solidity, do we congratulate ourselves on the formation of an excrescence, which should rather be viewed as the blotch and distemper of our nation.

12. But more than this, we are not to imagine of the excrescent, that it either indicates or creates the same addition to the resources of the country as an equal number of the natural population. Suppose that the excrescent should amount to a thirtieth part of the whole, we would estimate the matter wrong, by conceiving that a thirtieth part had been added thereby to the whole previous wealth and ability of the nation. Let us compare ten thousand of the disposable class taken from the natural population, with ten thousand of an excrescent population. The former give the products of their industry, or, if engaged in export manufactures, exchange them for other products, by which they obtain their equivalent maintenance from proprietors at home. The latter give the products of their industry in exchange for a maintenance which they draw from proprietors abroad. For each ten thousand of the natural population, we can put to the account of the country's wealth the work of ten thousand and the maintenance of

ten thousand. For each ten thousand of the excrescent population, we can only put to that account the work of ten thousand, for their maintenance cometh from abroad, and becomes only ours by parting with the commodities which are given in exchange for it. In estimating the wealth that is indicated by the existence of the former, we must take into account both the produce of the land which maintains them, and of the labour which they give in return for their maintenance. In estimating the wealth that is indicated by the existence of the latter, we can only take the produce of the labour into account, without the produce of land. In the one case, we can reckon as the property of the nation, both the work and the ultimate equivalents of the work. In the other case, we can reckon but the work—for the ultimate equivalents are produced elsewhere, and form an integral part of the wealth of some other land. Dr. Smith defines the wealth of a country to consist in the annual produce of its land and labour. An industrious member of the natural population, adds the produce of his labour to his country, and by means of it he fetches a counterpart produce from the land, which is also to be added to the country's wealth. An equally industrious member of the excrescent population, also adds the produce of his labour to his country's wealth—but the counterpart produce of land which he purchases therewith, must be reckoned to the wealth of another country. If the former do not create, he

at least represents a double wealth in the country, beyond what the other does. So that a given excrescent population betokens only half the wealth which an equal natural population does. If the excrescent population amount to a thirtieth of the whole, the wealth associated with their presence will amount to a sixtieth of the whole. The commerce that is pushed beyond the agricultural basis, to the extent of employing an excrescent ten thousand men, does not effectuate the same addition to a country's resources, as if the agricultural basis were itself extended by means of reclaimed land, or of an improved husbandry, so as to afford the additional subsistence of ten thousand men. In the one case, we have the additional work of ten thousand; but we must accredit the wealth of another country, and not our own, with their maintenance. In the other case, we have the additional maintenance of ten thousand, and, followed up as this must be, with an increase of population, we should soon have the additional work of ten thousand to the bargain.

13. But it will still more strikingly exhibit the insignificance, in a national point of view, of the excrescent, when compared with the natural population, if we attend to the relation in which they each stand to the revenue or service of the state. The excrescent population is made up exclusively of labourers and capitalists; and every tax, whether on their income or on the commodities they use, lessens their remuneration, so as to make a

higher price necessary for the commodities prepared by them, in order to keep up that rate of wages and rate of profit, without which their manufacture or business could not possibly go on. But in this way the price may rise so high as to cut them out of foreign markets altogether; the advantage of their British situation, in virtue of which they might have been enabled to undersell the traders of other countries, being so much counter-vailed by British taxation, as that they at length come to be undersold. It is thus that every such tax lessens the amount of our excrescent population; and, if carried to a certain extent, would cause it wholly to disappear from our borders. At the most, then, the excrescent population can only be made to yield a small fraction, and that a very precarious one, of their wealth to the exigencies of the public service. But let us compare with ten thousand of their number, any ten thousand of the natural disposable population. In the first place, as to those of them who are engaged in home manufactures, however high their wages may be raised by taxation, the inland proprietors, for whose enjoyment they labour, cannot escape from the consequent high prices of those commodities, in the preparation of which they are employed. In the second place, as to those of them who are engaged in export manufactures, their wages admit of being raised by taxation, till the inland consumers shall find that they can obtain the return articles from abroad, at a cheaper rate, by the exportation of

agricultural produce. In either way, it will be found, that, compatibly with their existence and full extent, the natural population could bear to be much more highly taxed than the excrescent population could. But what is more, the landlords at home, who maintain ten thousand of the natural population, can be reached by a direct tax; so as not merely to transfer a certain fraction, but any fraction whatever, nay, even the whole of this natural population, to the service of government. If a landlord abroad still continue to purchase the manufactures of our excrescent population, though they come to him at a price enhanced by taxation a tenth part more than they would otherwise have cost him; then, for every ten of our people whom he maintains in his own service, he may be regarded as maintaining also one in the service of the state. It is thus that for each ten thousand of our excrescent population, government may raise as much by taxation, as might enable it to command the services of a thousand men. But it could, by means of that higher taxation, which would abridge or annihilate the excrescent population altogether, command a much larger proportion of the services of our natural population; and, by means of a direct tax upon landlords, could obtain a command over the services of the whole ten thousand. An excrescent population indicates but half the wealth of an equal portion of the natural population, whatever direction that wealth may be left to take. But the proportion is

far more insignificant, when we compute the respective amounts of wealth from each, that might be made available to the public revenue, or to the general good and service of the nation.

14. Yet insignificant in point of national advantage, nay, hazardous in point of national security as we hold this excrescent population to be, we would not recommend a corn law to prevent the formation of it.* But still less would we recommend any of the expedients of a mercantile policy, to foster it into being, or force it into greater magnitude than that at which it would naturally settle. More especially, in the circumstance of being undersold by our neighbours in any of the branches of commerce, we can read no symptom whatever of disaster to the country, but would rather hail it with satisfaction, as that which tends somewhat to limit or to abridge the excrescent population. This points to a policy more generous far than the narrow and heart-burning system of prohibitions, alike dissatisfying to the people abroad and the people at home. We would not, on the one hand, restrain the freest importation of food ; but neither, on the other, would we restrain the freest exportation of British skill, whether in the shape of British artificers or British machines. All that we gain by the opposite proceeding, is the very questionable good of an excrescent population, who expose us to danger, and yield us no countervailing benefit in return for the room they stand upon. We have enough

of natural superiority in our situation and products, to secure us at all times, against any large or permanent exportation of food ; or, in other words, to secure for us a population commensurate to our agriculture. The advantage of having a population beyond this, is far too problematical to be worthy of the contention and the keenness by which the rivalry of merchants is characterized. We can afford to participate freely with our neighbours, in all the advantages which belong to us as a manufacturing people ; and, so far from regarding with any sentiment of jealousy the exportation of British capital or intelligence to other shores, we should conceive, that in this instance too, the magnanimous policy would be found the best for the true interest and safety of the nation.

15. On the whole, however, we believe, that in a perfectly free state of things, there might be a considerably larger importation than now of foreign grain into Britain, and of course a larger excrescent population. The causes however already specified, the increasing dearness of imported corn, the increasing cheapness in foreign markets of British commodities, and lastly, the constant tendency to equalization, in point of skill and other advantages between our own and other nations, would all conspire to limit the amount of this importation ; and our hope is, that both the foreign and the excrescent might ultimately settle down into a very small and manageable fraction, first of the natural produce, and second of the natural

population of our island. Still to this quarter we may look for a certain stretch or enlargement of external resources, whereby room and sustenance would be afforded for a greater number of families than we can now accommodate. Yet, after all, like every other augmentation in the outward means of support, it would but afford a temporary relief to the pressure under which we are at present labouring. As is usual with every increase, from whatever quarter, of the means of subsistence, it would be speedily followed up by a multiplication of our numbers, and so land us in a larger, but not on that account, a better-conditioned community than before. They who are sanguine of this and other resources, as if a permanent sufficiency for all our families were to be the result of them, would do well to consider the vast enlargement that must have taken place within the last half century, in the produce of our home agriculture; and yet the actual straitness that is felt in spite of it. The phenomenon admits of an easy explanation, palpable as plainest arithmetic to the understandings of any, who will but compare the censuses of different periods, and reflect on the rapid increase of our British population. And on what principle can we expect, that an enlargement of resources from any other quarter, will not be followed up by as full a proportional increase of population as heretofore; and, of consequence, that we shall still find ourselves overhung by the same pressure, and in the midst of the very same

difficulties as those which now encompass us. That the pressure may be somewhat lightened, for a moment, by the abolition of corn laws, and by several other abolitions and changes also, we cannot deny. But the same important remark is applicable to all of them. It is not by means of economic enlargements, but of moral principles and restraints, that the problem of our difficulties is at length to be fully and satisfactorily resolved. No possible enlargement from without will ever suffice for the increasing wants of a recklessly increasing population. We look for our coming deliverance in a moral change, and not in any, or in all, of those economic changes put together, which form the great panacea of so many of our statesmen. Without the prudence, and the virtue, and the intelligence of our common people, we shall only have a bulkier, but withal as wretched and distempered a community as ever; and we repeat, that a thorough education, in both the common and Christian sense of the term, forms the only solid basis, on which either the political or economic well-being of the nation can be laid.

CHAPTER VIII.

ON THE SUPPOSED EFFECT OF TAXES IN AGGRAVATING THE CONDITION OF THE LABOURING CLASSES, WITH THE CONVERSE EFFECT WHICH THE REMISSION OF TAXES IS CONCEIVED TO HAVE ON THEIR RELIEF, AND THE ENLARGEMENT OF THEIR COMFORTS.

I. *Effect of a tax on the net rent of land.*

1. THERE is not a more popular topic of declamation than the oppressiveness of taxes, and, more especially, their injurious effect on the condition of the working classes in society. The imagination is, that, when laid on the necessaries of life, they trench directly on the comfort and sufficiency of the labourer; and that, when laid on profit, or laid on commodities in general, they trench upon capital, and so upon that power which exists in the country for the remuneration of labour. It is thus that the distresses of the poor, and the straitened condition of the lower orders generally, stand associated in many a mind with the exactions of government. The effect of this opinion is, not only a rancorous politics on the part of the turbulent, but, even among calm philanthropic men, there is the pretty frequent persuasion, that each retrenchment in the expenditure of the state is so much clear gain to the com-

mon people ; and that, by pressing an indefinite economy upon our rulers, they are on the right way for an indefinite augmentation of personal comfort, not to particular classes only, but to society at large. It is therefore of importance to investigate the matter ; for, if this abridgment of taxes be really not the specific, which is to charm away all want and wretchedness from our land, the attention of the patriot may, in the meanwhile, be diverted from the best expedient for the relief and amelioration of its families.

2. Now, there is one species of tax which, by the consent of all economists, stands exempted from the charge of infringing on the comfort of the working classes. We mean a tax on the net rent of land. The incidence of such a tax is altogether upon the landlord. He is made poorer by it ; but no other individual or order of the community needs to be at all affected. A portion of the power which he had to purchase commodities, or to maintain labour, is doubtless taken out of his hands. But it is not annihilated. It is only transferred. After the imposition of the tax, the united expenditure of government and the landlords equals precisely the whole expenditure of the landlords previous to the tax. In the new state of things, there might be just as large a profit to capitalists as before, and just as large a maintenance to workmen as before. By every such tax, the power of government to uphold or reward industry is just as much enlarged as the power of the landlords is lessened. A cer-

tain part of the disposable population, employed in preparing luxuries for the proprietors of land, are placed by the operation of the tax at the disposal of government. To them it needs be no other change than a change of masters—a change of employment. From the hands of their new employers, they may obtain as large and liberal a support as they did from their old ones. They may have the same support as before, but for a different service. They exchange the service of working up luxuries to private consumers, for the service of the state. They are withdrawn from the business, either of home or export manufactures, by which they minister to the enjoyment of landed proprietors, to the business of manufacturing government stores; or of fabricating the whole material of government service, such as ships, and fortifications, and barracks, and churches, and colleges, and prison-houses; or finally, to the direct business of war, or justice, or public instruction. Artizans may, in thousands, be transferred thereby into soldiers, or into artizans of another species. Master manufacturers may, in tens, or hundreds, be transferred thereby into officers, or judges, or clergymen. And the latter may be upheld in as great splendour, and the former in as great sufficiency as before. The wealth thus transferred into the coffers of government, can be discharged with as great liberality and effect on the various servants of government, as it formerly could when discharged by the landed proprietors themselves, through the countless chan-

nels of trade and manufacturing industry in the land. After this change, we may still behold the spectacle of as large a population, in every way as liberally upholden, with the only difference of being differently employed. There is no effect produced on the reward of industry, but solely on the distribution of it. They who are paid by the tax may live as well as before. They who pay the tax are the only sufferers. They lose so many of their luxuries—or rather, they exchange them for the objects of the public expenditure; perhaps, through the medium of fleets and armies, for national independence; perhaps, through the medium of schools, and churches, and colleges of justice, for the protection of society from crime and violence, and for the increase of national virtue. Even to them, the tax-payers, it may not be a dead loss, but the substitution of one benefit for another—possibly the substitution of a greater for a lesser benefit.

3. Yet it may be observed, even of this least obnoxious mode of taxation, that it may be conducted in such a way as to lay an arrest, or even to impress a retrograde movement, on the wealth of the country, and essentially to injure it in all its economic interests. Under a government of capricious despotism, and unmeasured rapacity, even though it confined, which it would not, its exactions to the net rent, and left untouched all the profits of agricultural capital, as well as the capital itself—the cultivation of estates would languish or decay, from the want of consent and of active countenance on

the part of the landlords. The proprietor would lose every inducement to patronize an improving tenantry, if he were sure that all the additional rent, which accrued to himself, was to be absorbed in taxes. Even if he were not sure—if in a state of insecurity whether he was to get any of the additional rent that is yielded by land on its better cultivation, or of ignorance how much he would be permitted to share of it—there behoved to be, on his part, the feeling of a slackened interest, and so a far less careful and vigilant administration of the property. It is thus that the taxations of a government, which wanted steadfastness of principle and good faith, would relax and retard the agriculture of a country, even though these taxations were restricted to the share which accrued to the landlord in the produce of the soil. But the case is very different when it is a taxation of principle; justified by the urgencies of the occasion; levied alike upon all in like circumstances; not liable to fluctuate, as in Turkey, with the cupidity of the rulers, though liable to be extended with the necessities of the state, of which necessities the landlords themselves, through the organ of a free and representative government, are the effectual arbiters. In these circumstances, there is scarcely any centage of taxation, however great, that would discourage cultivation. Nay, we believe that, in many instances, it has led to the extension of husbandry; and that to the income tax of England, while it lasted, we have to ascribe the breaking up of many a lawn,

and pushing forward agriculture to many outfields which had not been entered. The tax, in these cases, stimulated the cultivation. The landlords sought, by a more strenuous agriculture, to compensate for the deprivations which the tax laid on them. They drew upon the land for an additional produce, wherewith to meet the impositions to which they were subjected; and though this cannot be done indefinitely, yet done it was in many instances, when from negligence or pleasure, an estate had not even the average cultivation bestowed upon it. We are aware that under an oppressive and arbitrary system, the tax would not operate in this way. In a country where the government could seize on individual property, no man would try to indemnify himself for one imposition, by means of an additional produce that might just bring on another imposition. The case is altogether different, when the tax, though severe, is equitable, that is, laid in like proportion over the whole country. Each proprietor, feeling that he is safe from any wanton or unlooked for exaction in future, seeks from the capabilities of his soil, after all the reimbursement which it can afford, for the exactions that already lie upon him. In these circumstances, we really cannot specify to what extent the taxation on net rent may not be carried, because of the discouragement it would give to cultivation. For this purpose, the taxation would need to be not only excessive; but discretionary, partial, at the mercy of a wayward and

E

unprincipled government, and altogether such as left no reasonable security for the enjoyment of any remainder by the landlord. The effect is totally dissimilar, when the landlords are not only the payers, but, through the predominance of their will in parliament, the establishers of the tax. And then, when the question is put, How far might this taxation on themselves be carried, without injury to the economic interests of the nation—it is obvious, that it might be carried indefinitely near to that point, at which, having surrendered all their luxuries, they satisfied themselves for a season with the necessaries of life. This may be regarded as the extreme limit of the taxation on net rent; and by the actual distance of our landlords from this limit, by the degrees in which they still can command and enjoy the luxuries of life, do we estimate the power which remains with them of adding to the revenue of the state. They could, on some high call of patriotism, transfer to the service of government, all the disposable population whom they employ. They could transform a million of manufacturers into soldiers. They could, if the emergency called for it, assemble round the standard of the nation's independence, a host many times greater than has yet been exemplified in British warfare; and, so far from touching on the *ne plus ultra* of our public resources, we, on the test of that command which still remains with our landlords over the luxuries of life, do confidently aver, that never was our nation in greater sufficiency for

such sacrifices as might conduce to some high object of patriotism or the public weal.

4. We admit, that by a tax upon net rent, the power of the landlord to improve his estate is abridged; and yet, we hold, that the progress of this improvement does not, now-a-days, materially depend, either on his capital or on his enterprise. It is not at this time of day, that we have to complain of the want of capital for any operation, capable of yielding a return, or of replacing the outlay with a profit. We must recollect the opulence of our tenantry, and their ability to enter on improving leases, in all parts of the country where improvement is hopeful. Or, if the proprietor behoves to be the improver, we must recollect the perfect facility wherewith he can now borrow to any extent on the security of his lands. When capital is at a loss all round for a profitable investiture of itself, and, labouring under the weight of its own plethoric magnitude, is ever and anon getting the relief which it needs in the bankruptcies attendant on all wild and precarious speculations—we may be very sure, that nothing is wanted, but the prospect of a safe, though moderate return, for drawing capital to agriculture. In other words, capital will never be wanting to agriculture, so long as agriculture is able to yield a profit to capital. The truth is, that capital has, in every business, a constant tendency to overshoot itself, by the application of it in larger quantities than the business can replace with a profit. And this is

just as much the case in agriculture, as in any thing else. So that though every landlord were to spend to the uttermost of his power, whether on his own private gratifications, or in the support of government, we have nothing to fear for the progress of cultivation. There is perfect security that, on the one hand, a more productive agriculture will bring on a larger population; and that, on the other, an increasing population will so uphold the demand for food, as to encourage and speed onward the progress of agriculture. Meanwhile, the landlord, though sitting merely as a recipient, if he but give his consent and countenance to the requisite administration, will reap the benefits of a process in which he takes no active share. His rents flow in upon him without exertion on his part. He will be glad to receive the whole—but should government interpose with its taxations, he will not reject the part which remains to him. The man of a thousand a year will be glad of an additional hundred—but not more so, than a man of five hundred a year is of an additional fifty. A tax then of fifty per cent. on the net income of landlords, would still leave them in possession of as zealous an interest as heretofore, in the improvement of their property. And should government but leave the profits of capital and the wages of labour untouched by their exactions, we are not able to say when it is that the share which government appropriates of the net rent becomes so large, as, by its adverse influence on the

mind of the proprietor, to arrest or even to retard the progress of cultivation.*

5. Anterior then to all consideration of what might be yielded, if indeed any thing is yielded by profit and wages to the service of the state, there is at least one source of public revenue that might well stand exempted from the obloquy of indignant patriotism. A tax on the net rent of land needs not to trench on the income of capitalists; for the united expenditure of government and the landlords can afford them as large an income after the tax, as did the unbroken expenditure of the landlords before it.† It trenches not on the comfort of labourers; for all the power of maintenance that has been withdrawn from individual proprie-

* "Both ground rents, and the ordinary rent of land, are a species of revenue which the owner, in many cases, enjoys without any care or attention of his own. Though a part of this revenue should be taken from him in order to defray the expenses of the state, no discouragement will thereby be given to any sort of industry. The annual produce of the land and labour of the society, the real wealth and revenue of the great body of the people, might be the same after such a tax as before. Ground rents, and the ordinary rent of land, are therefore, perhaps, the species of revenue which can best bear to have a peculiar tax imposed upon them."—*Smith's Wealth of Nations*, Book V. Chap. II.

† We employ the term income, rather than profit, because the expenditure from the hands of government being more directed to the support of what economists term unproductive labour, may be more in the shape of annual payments, and less in the shape of prices for commodities, than when that expenditure came from the hands of the landlords.

tors may still be discharged as liberally as ever from the coffers of the treasury. It changes only the direction of industry, and not the remuneration of it. As many of the disposable population as the produce of the tax can maintain, were employed in the manufacture of luxuries; or, while this produce was suffered to remain in the hands of the landlords, they laboured in the service of the landlords. When this produce was taken out of their hands, the maintenance of that population was transferred into the hands of government, and themselves were transferred to the service of government. There might be an abridgment of trade and manufactures by this process; for, instead of preparing tangible luxuries, the greater part of those whose employments shall have thus been shifted, might be engaged in what many economists call the unproductive service of naval or military defenders. This new distribution of our people would have the effect of lessening the trade of the nation; and to those who idolize trade, as if it possessed some mystic virtue in itself, over and above the power of ministering through the medium of its own articles to the enjoyment of customers, this might appear a great national evil. But, in truth, the gratification which consumers have in the use of its commodities, is the great, the only service which trade renders to the commonwealth. This, we admit, is destroyed by the tax. This is given away in exchange for whatever benefit the tax may be laid out in purchasing. Landlords

have lost their luxuries. But there is no other loss. Every other benefit which has helped to associate in the minds of men the idea of prosperity, with the idea of trade, is fully and perfectly retained. Whatever power lay in the produce of the tax, when in the hands of its original owner, abides with it still, when in the hands of government. And with the single exception of landlords being shorn somewhat of their household, or stinted somewhat in their personal enjoyments, do we behold the spectacle of as large a population, in circumstances of as great comfort and sufficiency as before.

6. Having this view, we cannot sympathise with the despondency of those who represent our nation as in a state of extremity and exhaustion. And neither do we comprehend how it is, that taxation cannot be further extended, without bearing oppressively on the maintenance and industry of the people. We hold that there is a world of delusion in the invectives upon this subject, whether of demagogues out of parliament, or of the champions of reform and retrenchment within its walls. There is at least one direction, in which taxation may be carried further, without even the semblance, and certainly without the reality of any encroachment on the means of the general population. A territorial impost, any where short of the net land-rent of the kingdom, would but trench on the luxury of landlords, without at all trenching on the livelihood of the other classes. And to speak of our

yet touching on the limit of our resources, or even being within sight of it—when the equipage, and the splendour, and the thousand effeminacies of luxurious expenditure, are so paraded before our eyes! We are aware, that the national debt falls with the weight of a mortgage on every estate in the island; a weight, too, that has of late become more oppressive, by the change which has taken place in the value of money. But, looking comprehensively at the matter, these mortgagees should be regarded in the light of landed proprietors. By the national debt, there has virtually been a division between them and the land-owners of the territory of the empire. Regarding, then, both the land and the stock-holders, as in fact proprietors of the soil, and as sharing between them the net rent which accrues from it; who will deny, that between these two classes, there is at this moment a greater fund for taxation and for the exigencies of the state, than there ever was in any former period of the British history? We have only to survey the distance at which, in habit and expenditure, they stand from the necessities of life; and, looking on this as the intermediate ground, on which government might proceed indefinitely to appropriate for its own uses the price of their luxurious indulgences, we venture to affirm, that never was there a greater capability than now, for enlarging the number and allowances of the public functionaries, or for imparting efficiency and extent to all the departments of the public

service. A levy of ten per cent. both upon land and fund holders, would at this moment invest government, if not with a larger nominal revenue, at least with a real power of command over the services of a larger disposable population, than the same levy would have done at any former period in the history of our affairs. The funds for such an enlargement of the national revenue do exist in the country; and, without the injury of one economic interest, these funds may be drawn upon, with no encroachment whatever on the sufficiency of the common people, and no other loss to the classes above them, than the loss of a splendour and a luxury unknown to their forefathers.

7. By disentangling and keeping distinctly apart from each other, the sources out of which a public revenue might be drawn, we are enabled to perceive, in spite of the very prevalent notion to the contrary, how far we yet are from the extremity of our national resources. Even at the time, when an additional revenue seems hopeless, from any, or all the branches of trade put together; there might still be a fund, convertible by taxation to the purposes of government, and of greater amplitude than at any former period of our history. It follows not, because wages are sinking in every department of industry, or profits are brought to that minimum condition, beneath which the capital of a nation must decay—it follows not, on these accounts, that government has arrived at the *ne plus ultra* of her possible income or possible expen-

diture. This would be true, if the only way in which a public revenue can be raised, is by extracting out of the existent trade of a country some fraction of its gains. Whereas, instead of this, let there be a tax on the net rent of land, and then a certain portion of the trade would of necessity be destroyed; when, instead of drawing, by an impost upon commodities, but a part of its value, the whole gross value of the destroyed trade may in fact be transferred to the coffers of the treasury. The capitalists and workmen disengaged in consequence, may be as liberally supported as before in the service of the nation; while the capitalists and workmen who remain may have still the same remuneration in the trade which survives. This, then, is a species of tax to which the common-place declamations of an overburdened commerce, or an overburdened and oppressed industry, are wholly inapplicable. Both may be overburdened by the weight of their own redundancy, when capital and population are alike in excess; but taxation, when confined to the proper revenue of landlords, is innocent of it all. And the proper test for the capability or the possible extent of this taxation, is just the power of land and fund holders to maintain a disposable population, who prepare for them the superfluities of existence; and never, may we venture to affirm, was there a greater length and breadth of this capability than at the present moment. Never had government less excuse for foregoing any of the high objects of patriotism,

because of inability fully and liberally to provide for them all. We repeat, that it is not the necessity of the lower, but the luxury of the higher classes, which at all stands in the way of our great public interest, and that every one of them might be most generously supported, with but an abridgment to the luxuries of the one class, and with no aggravation whatever to the necessities of the other. It is only because things are looked to with distorted vision, that the retrenchments which are now made at the altar of popularity, are hailed as so many acts of relief to the general population, when, if beheld in their true character, they would be regretted, by every sound patriot, as a sacrifice of the public good to the splendour and effeminacy of the upper orders in society.

8. The notion is very prevalent, both among economists and statesmen, that commerce and manufactures are the fountain-heads of the public revenue; and that if, by any chance, these are obstructed or dried up, the great source whence a government obtains its supplies is dried up along with them. The tax on a commodity forms a fraction of its price; so that when the commodity ceases to be produced or sold, when no price is given for it, the tax, in its present form, necessarily disappears: and it would therefore seem as if, with the cessation of the trade, government were to lose part of its income. It requires, we should think, no great stretch of vision to perceive, that the manufacture is not the originator of a revenue to govern-

ment, but only the occasion, or the channel, through which government reaches the purchaser of the manufactured commodity; and that, though the manufacture were destroyed, the wonted ability of the purchaser is not therefore destroyed. The truth is, that, by means of a direct impost, government could draw from him the whole price of the article in question, instead of a fraction of that price by means of a tax on the article. It is neither the sugar, nor the tea, nor the wine trade, which produces a revenue to government. These produce nothing but sugar, tea, and wine; and did the nation consent to the sacrifice of these luxuries, government might receive the whole price now given for them, instead of a proportional part in the shape of duty. What else, but an undue sense of the virtue which resides in trade and manufactures, could have led Dr. Smith to assert,* that a commercial country, like ours, could afford no more than a hundredth part of its population for the business of war; else its commerce, deemed by him the very source of those finances by which war is supported, would go into languishment and decay—whereas, though the whole of that immense com-

* He at least states what the common estimate is, without qualifying or contradicting it. “Among the civilized nations of modern Europe, it is commonly computed, that not more than one hundredth part of the inhabitants of any country can be employed as soldiers, without ruin to the country which pays the expense of their service.”—*Wealth of Nations*, Book V. Chap. I

merce, which is busied in providing the superfluities of life were this instant to be annihilated, it would still leave in the hands of the consumers the maintenance of the whole disposable population, out of whom a ten-fold greater military strength might be made to arise, than our illustrious economist dared to contemplate. And how else can we explain the egregious error of Mr. Pitt, who confidently foretold the overthrow of France, because, in the ruin of her trade, he conceived that her means of defence and of warfare were utterly exterminated? The truth is, that it was the wreck of her commerce which created her armies. Her disposable population, disbanded from their former pacific employments, flocked in myriads to the standard of independence, and at length of aggression and conquest over all her enemies. Their old employments failed them, but their maintenance did not fail them. It remained in the hands of those who went to be their customers; and, when surrendered by them, at the call of patriotism, or the bidding of an energetic government, for the necessities of the state, it was made available for the support of the same population, now transferred from the business of trade to the business of war. This destruction of their trade, on which Pitt founded his calculations of their downfall, was the very thing which made them the scourge and the terror of all Europe. It transformed millions of artisans into soldiers; and in very proportion to their decay as a manufacturing, was their extension and their

growth as a military nation. Then fancied weakness turned out to be their real and formidable strength; and in that mighty re-action, which took place on the breaking up of the old system of their affairs, have the principles which we now try to expound received, from the finger of history, their most signal and conclusive demonstration.

9. We gather, from this argument, that there might be a misplaced antipathy to taxation. We could understand the sentiment, and would also share in it, should it be made to appear of any tax, that it dries up the springs of our economic prosperity, or trenches, in the slightest degree, on the comforts of the poor man and the labourer. But if, on unravelling the mechanism of human society, it becomes evident, that there is but the semblance of this effect without the reality, it ought to mitigate our indignation, and in certain cases, perhaps, to transfer our generous and patriotic sensibilities to the opposite side. A tax on the net rent of land is clearly of this description; abridging nothing, by its operation, but the luxuries of the wealthier classes, and appropriated, as its produce may be, to the extension of the best interests of the commonwealth. The popular representation of the matter is, that, in virtue of our enormous taxes, the minions of government are allowed to fatten on the spoils of the nation, to the further hardship and oppression of its starving multitudes. We believe the juster representation to be, that, in virtue of a sweeping and blindfold retrenchment, the

affluent proprietor is enabled to live in greater splendour and delicacy; and that by a farther reduction on the hard-won earnings of those who are the public's most useful and labourious servants. The monarchy is shorn of its splendour; the great offices of the state are stripped of their graceful and becoming dignity, the system of public instruction is stinted of its needful allowances; the requisite agency for the business of government is crippled in all its departments, our gallant warriors pine in sordid destitution, science, in the Gothic barbarity of our times, is unfostered and unrewarded; in a word, the glory and substantial interests of the nation are sacrificed,—and all with no other effect, than so to ease the landed and the funded aristocracy, that they may be more delicately regaled, or more magnificently attired and attended. The tax, we repeat, does not trench on the livelihood of the poor, but on the luxuries of the rich; and statesmen, misled by a false political economy, or looking only at the surface of things, have made surrender, to a very phantom, of the highest objects of patriotism.

10. We confess that, on this subject, we have no sympathy with what has been called the spirit of the age. The very worst effects are to be dreaded from it. Every thing now is made a question of finance; and science, with all which can grace or dignify a nation, is vulgarized and brought down to a common standard—the standard of the market and of the counting-house. It does look menacing,

to take one example out of the thousand which may be specified, that it hinged on one solitary vote,* whether the trigonometrical survey of our island should be permitted to go on—a work which, like the doomsday-book of England, might after the lapse of a millennium still survive, as a great national index for the guidance of our most distant posterity. It makes one tremble for some fearful resurrection of the old Gothic spirit amongst us—when one thinks that we were within a hair-breadth of this noble enterprise being quashed. And this is the spirit of the age¹—an age of unsparring retrenchment; a regime of hard and hunger-bitten economy, before whose remorseless pruning-hook, lie withering and dissevered from their stem, the noblest interests of the commonwealth; a vehement outrageous parsimony, which, under the guise of patriotism, so reigns and ravens over the whole length and breadth of the land, and cares not though both religion and philosophy should expire, if but some wretched item of shroud and of candle-end should be gained by the sacrifice; this, though now the ascendant policy of our nation, elevated into power by the decisions of the legislature, and blown into popularity by the hosannahs of the multitude, will be looked back upon by posterity as an inglorious feature of the worst and most inglorious

* It is but fair to say, however, that the majority of one for the continuance of the survey, was in the vote of a committee, which, though it had been adverse, would still have been subject to correction in the House of Commons

period in the annals of Britain ; the befitting policy for an age of little measures and little men.

11. We are aware of the sacrifices which are now being made at the shrine of popularity. A loud call for economy, in all the branches of the public service, has been met to the extent of a most hurtful reduction, both in the number of our national functionaries, and in their allowances ; without, we venture to affirm, one particle of addition to the comforts of the general population. In as far as the taxation falls upon landlords, then, it but transfers the services of the people to other masters, without effecting necessarily a diminution of their wages, and the remission of such taxation will but commit them back again to their old employers, and without the increase of their wages. We therefore hold, that those politicians and philanthropists are altogether on a wrong track, who act as if this were the expedient by which aught like permanent relief is to be obtained for the working classes of society. Let capital continue to press on the business of the country as before, which it will do, so long as the appetency for wealth preponderates over a taste either for the luxuries which wealth can purchase, or the generosities which wealth enables us to exercise ; and let population continue to press on the food of the country, which it also will do, so long as the love of animal enjoyment predominates over a taste for the comforts and decencies which even humble life might attain to, and nothing within the compass of hu

man wisdom can be devised, by which to save either the distempers of our commerce or the destitution of our peasantry. Government will have the mortification to find, that, after having dismantled its various establishments, to the great damage of great national interests, it will have still the same encounter to maintain, (and that, too, in midst of the weakness and helplessness to which itself has voluntarily descended,) with as wretched, as dissatisfied a population as before.

12. But we have only reasoned, hitherto, on the effect, not of all taxation, but of a special taxation, even that on the net rent of land. But the great majority of our actual taxes appear to fall on profit and wages; and on the incidence and effect of these we reserve ourselves for the following chapter.

CHAPTER IX.

ON THE SUPPOSED EFFECT OF TAXES IN AGGRAVATING THE CONDITION OF THE LABOURING CLASSES, WITH THE CONVERSE EFFECT WHICH THE REMISSION OF TAXES IS CONCEIVED TO HAVE ON THEIR RELIEF, AND THE ENLARGEMENT OF THEIR COMFORTS.

II. *On the taxes which seem to affect profit and wages.*

1. WHEN a tax is laid upon net rent, the landed proprietor can claim no indemnification for it, from the other classes of society. There is not a sounder principle in political economy, than that it is not the rent of land which causes the high price of agricultural produce—but that the high price of agricultural produce, brought on by other influences, is the cause of rent. The landed proprietor cannot indemnify himself for the tax, by putting, at his own pleasure, a higher pecuniary value on the products of the soil. It is not the will of the landlord which determines their price. The price of corn fluctuates, like that of every other commodity, with the proportion which the quantity of it brought to market bears to the demand. If, on the one hand, the population choose to multiply, though with the surrender of a part of their wonted comforts; this, by adding to the number and com-

petition of the buyers, will raise the price of corn, without any will or exertion on the part of the landlords. Or if, on the other hand, it be the collective will of the population, to forego the pleasure of early marriages, for other and higher pleasures—this may so slacken the demand for corn, that its price, relative to labour, may become lower than before. It is not the landlord, who either raises the price of grain in the one case, or lets it down on the other. He is the mere recipient of a surplus, the amount of which is determined, by causes extrinsic to himself and independent of himself. He cannot augment this surplus at his pleasure, so as to indemnify himself for the share which government chooses to assume of it. They take from him the maintenance of a certain part of the disposable population; and, along with this, they take from him the services of that population. But this change does not affect, either the number of the disposable population, or their power of purchasing. These remain unaltered, and so the price of agricultural produce remains the same as before. Landlords, therefore, have no way of making their escape from the impositions of government; or, of shifting the burden from themselves to any other class of society. And, if it can be proved, that, in this respect, they stand distinguished both from capitalists and labourers; if these find relief from the taxes which are laid upon them, in the higher prices of what they sell, or in the higher wages of what they work; then, all

taxes, however ostensibly laid, in the first instance, will be found, ultimately, to land on the proprietors of the soil.

2. Many are the instances in which it is quite palpable, that the first incidence, and the ultimate effect of a tax, lie on different persons. Perhaps the most frequent and familiar example of this is, when a tax on commodities falls at first upon the manufacturer or the dealer; but he indemnifies himself by raising the price, and so transfers the burden of it to the purchaser. He shifts the imposition away from himself to another, and the question is, whether there are not whole classes of men, who, though they do pay taxes ostensibly, do not, in fact, substantially and really, pay them at all. If a merchant, in particular, can escape from the tax laid on the commodity in which he deals, can he not equally escape from all attempts to reach him by taxation in some other way? If, by raising the price of his article, he can indemnify himself for a tax upon commodities, has he not the same resource against a tax upon profits, or a tax on any of the objects of his expenditure? * Certain enough it is, that a tax on

* Mr T. Peironet Thomson, in commenting on the opinions of an economist, who distinguishes between certain taxes which do fall upon purchasers, and certain which do not, shrewdly, and, in my opinion, soundly observes,—“ It would be curious to know how he convinces himself, that this is true, when the tax is demanded from the producer, under the title of a tax on his commodities, and would not have been true, if the same sum had been demanded from him, under the title of a tax on his profits ”

profits cannot be carried to the annihilation of all profit, or a tax on the expenses of living to the annihilation of the livelihood of capitalists, else trade and manufactures would altogether cease. On the first blush of the matter, then, there do appear to be certain compensatory processes, by which we are sure that some taxes are made up for to the capitalists; and which, perhaps, have enough of power and efficacy in them, to make up for all their taxes whatever. In like manner, it seems conceded, that no tax, either upon the person of the labourer or upon his maintenance, can trench so far upon his means, as to leave him without the power of supporting himself and family, in such a way as shall at least keep up the population of the land. In this department of society too, then, it would appear, that there is a compensatory process, by which the taxes that bear on the subsistence and comforts of the labourer, are either partially or entirely made up for; and must therefore be transferred to some other class who bear the burden of them. If it can be proved, that all taxes, affecting the status of the capitalists, are made up for to them by higher prices; and that all taxes, affecting the status of the labourers, are made up for to them by higher wages—this would seem to conduct us to the old doctrine of the French economists, though by a different process from theirs, that all taxes fall ultimately on the net rent of land. The common imagination is, that this is a doctrine which has been long exploded. The reasoning

may be exploded, but yet the doctrine may be true notwithstanding, and may be established on the foundation of other reasoning.

3. There is one argument connected with this doctrine, which has been occasionally touched upon by economical writers; and did we not hold ourselves in possession of another argument on the same side, still more clear and conclusive, we should have expatiated on it at greater length. Let us briefly advert to it before we proceed to the main reason, on which we ground our general affirmation, that taxes are not paid either by capitalists or labourers; or, to state the principle in more unexceptionable language, that they receive full compensation for the taxes which they do pay; the one in higher profits, and the other in higher wages, than without the taxes they would have received.

4. This argument which, in point of strength and obviousness, holds, in our estimation, but a collateral or subsidiary rank, when compared with the one on which we should feel inclined to rest the cause, is still worthy of being noticed, because it helps to explain the speed, wherewith a compensation arises to the capitalist and labourer, for those taxes which ostensibly fall upon them. The principle of the argument is, that whatever causes a more rapid, or rather a more copious circulation of money, without at the same time increasing the supply of commodities, raises the money price of them. We can thus conceive one way in which a

capitalist might obtain, at least in as far as circulating capital is concerned, an almost immediate compensation for a tax on profits. If, previous to such a tax, there be an hundred millions annually laid out in bringing goods to market, which are there sold for a hundred and ten millions, this capital is replaced with a profit of ten millions to its owners. But should a tax of ten per cent. be laid upon these profits, this, in the first instance, affects not the ability of those who purchase to the extent of a hundred and ten millions, seeing that the tax is laid upon the capitalists and not upon their customers; and, in the second instance, it enriches government to the extent of one million. Suppose this million to be expended by government in the purchase of commodities, then would the hundred millions of capital, after the tax of one million upon the owners, be replaced by a hundred and eleven, instead of a hundred and ten millions; or, in other words, the tax which they pay to government would reciprocate back upon themselves, in a consequent rise of the money-price of the commodities wherein they deal.

5. And the same is still more palpably true of a tax on the wages of labour. Should a hundred millions be given annually in wages, and government lay an impost of ten per cent. upon the labourers, the ability of the original hirers to make offer of a hundred millions next year for service, is not at all affected by such a tax. But then the effect of it is, that it enables government to com-

pete with them effectually in the labour market, to the extent of an additional ten millions; or, in other words, a hundred and ten millions may now be brought annually forward for the purchase of labour, instead of a hundred millions as before. But as there is no additional supply of labour by this process, the money-price of labour would just rise to the full amount of the tax which has been laid upon it. The labourers would obtain a full indemnity for the tax, by the produce of it coming almost immediately back upon themselves. Inasmuch, that were a poll-tax of five pounds a year laid upon each labourer, we hold that an almost instant compensation would take place, by a rise to the same extent in the money-price of labour. He bears it ostensibly, but not actually. In point of semblance, it is a tax upon him, but, in point of real incidence and effect, it is wholly upon his employers.

6. Before we take leave of this argument, let us state it in terms of greater generality. Let, on the one hand, the quantity of capital and labour in the country remain unchanged, and, on the other, the power of replacing the capital, and remunerating the labour also remain unchanged—and, however the latter power shall be broken down or divided, profits will remain the same, and wages the same. The effect of a tax on profit, or of a tax upon wages, would just be to bring an additional quantity of money, to the extent of the tax, into the market for goods, or the market for

labour; and, to that extent, raise the money-price of both. The effect, again, of a tax upon net rent, would be, to diminish the purchasing power of the landlords; to the extent only, however, that the purchasing power of the government was increased; and, without any increase of money-price, profits and wages would continue in name, as well as in substance, what they were before. The operation of a tax on profits and wages would be nominally to raise the income both of capitalists and labourers; though, substantially, they would continue what they were. If the tax were laid upon net rent, it would diminish the income of landlords without raising money-prices; and, therefore, without raising the income of the other two classes, either nominally or substantially. After the imposition of such a tax, the united expenditure of the landlords and government would be equal to the entire expenditure of the landlords before; and, under the new system of an expenditure undiminished in its amount, and only changed in its distribution, we should behold both capitalists and labourers in possession of the same money, as well as the same real income as formerly.

7. The same reasoning applies to every tax on those commodities which enter into the maintenance, either of capitalists or labourers; so as to show, that they can make as effectual escapes from the indirect as from the direct taxes which are laid upon them. We are sensible, at the same time, of the many evasions which might be practised, to ob-

scure, if not to frustrate this argument ; and of the many adjustments which it were necessary to make, ere we could fully meet all the difficulties that might be cast in its way. But we feel how superfluous it were to take the more labourious, when there is a shorter and easier path by which to arrive at our conclusion. We think that the argument employed hitherto, serves well to account for the very instant compensation which accrues to capitalists and labourers, when taxes are laid, either on their expenditure or their income. But whether this argument shall be sustained or not, there is still another, which proves irresistibly to our minds, that, in point of ultimate and permanent effect, taxes do not fall on either of these classes, a position which will be all the more convincing, if we but attend to the fundamental and efficient principles by which both the rate of profit, and the wages of labour are determined.

8. We shall, in the first instance, keep out of sight the effect which taxation may have in contracting the agriculture of a country ; and that, for the purpose of bringing out singly, and therefore more clearly, the main reason why, ultimately, the income of neither capitalists nor labourers can be trenchanted upon by taxation. We shall, after establishing this, take the agriculture into account, in order to complete our whole view of this subject.

9. If we but adverted to the dependence which profit and wages have on a mental or moral cause, we should at once perceive, of both these elements,

how little either of them can be affected by taxation. Of the first of them, profit, we know that, *other circumstances remaining the same*, it falls with every increase of capital, and rises with every diminution of it. This circumstance will at once let us see, that its rate depends on the taste and choice of the capitalists themselves; that is, on the proportion which their inclination to save bears to their inclination to spend. If the whole amount of revenue arising from profit be ten millions in the year, and it be the collective will of the capitalists to spend that sum annually; then profit undergoes no variation. If they spend less than this, capital increases and profits fall. If they spend more, capital decreases and profits rise. With this element brought into the computation, it will be perceived, how a tax might be laid, in the first instance, upon profit, and yet in effect not be paid by the receivers of profit. They have only to persevere in their wonted habits of expenditure and indulgence, and they can throw the whole burden of the tax upon their customers. Let it but be their collective will, to spend on their own gratification ten millions in the year, and the imposition upon them of a tax to the extent of one million, need not trench on their ability to maintain this expenditure. If their capital of a hundred millions was, previous to the tax, replaced by a hundred and ten, then, if after the tax they should continue to spend the ten millions and to pay the one, this would reduce their capital to ninety-nine

millions ; when, in the consequent higher prices of next year, they might have a full compensation for the tax. Let the replacing power, notwithstanding the tax, continue as before, at a hundred and ten millions, this sum, given in return for the ninety and nine, would raise the profit from ten to eleven millions, and so meet the whole imposition that had been made on this branch of the national revenue. The burden would thus be effectually thrown off from the capitalists, and laid on those who purchase their commodities.

10. And the same would be the result of a tax upon wages. *Other circumstances still being equal*, they fall with the increase, and rise with the decrease of the population. The rate of wages, therefore, has a close dependence on the proportion which the inclination of the people for marriage, bears to their inclination for the comforts and the decencies of life. In other words, it is ultimately decided by a mental or a moral cause. Give the people a high standard of enjoyment, and, rather than sink beneath it, they will postpone matrimony for a season ; or, in other words, we should have later marriages and smaller families. Through the medium of popular intelligence and virtue, this result will be permanently arrived at—and through no other medium. The rate of wages is fixed by the collective will of the people themselves. They are the arbiters of their own condition ; having absolute control over that element on which there hinges the amount of their remuneration for labour ;

and, if they choose not to exert that control, there is positively no other expedient by which a commonwealth can be saved from the oppression of an underpaid and degraded peasantry. But if, on the one hand, no devices of philanthropy can save a population of sordid and grovelling habits, from that most over-mastering of all oppressions, the oppression of their own numbers—on the other hand, no weight of imposts can permanently depress a moral and educated people beneath that elevated position which themselves have fixed upon, and which themselves are abundantly able to maintain. This alliance between a people's character and a people's comfort, is far the most valuable lesson in political science, and is convertible to the most precious applications which can be made of it. We do not think that even the immediate effect, or at least the effect beyond one year, of a tax on wages, is to lessen the remuneration of the labourer; but even if it had, it could have no such effect permanently. It could not reduce the economic state or condition of men, who have an absolute dictation over the proportion between the demand for labour and the supply of it. They can countervail the operation of such a tax by their habits; and, having unlimited command over the supply of labour, they can, by a moral economic check on the magnitude of this supply, sustain, in the midst of all adverse elements, whether physical or political, the attitude of an erect and well-conditioned peasantry.

11. A tax on profit leaves the capitalists at free-

dom to embark less of capital on business than before ; and, failing an immediate rise on the price of their commodities, if, on the average, they choose to keep up their wonted personal and household expenditure, and the tax compel them, for this purpose, to trench upon their capital, they have, at length, a full compensation in the increased profits of trade. A tax on wages leaves the labourers at liberty to marry later than before ; and, failing an immediate rise on the money-price of work, if, on the average, they choose to postpone marriage, till they are enabled to enter upon it without any compromise of their wonted enjoyments, they may at length from a lessened population, have an equally full compensation in the consequent rise of the value of labour. A certain average style of expenditure, resolutely adhered to by manufacturers and merchants, could, through the medium of a diminished capital, act upon profit, so as to yield them an indemnification for their tax ; and the same principle, a certain average style of expenditure, resolutely adhered to by labourers, could, through the medium of a diminished population, act upon wages, so as to yield them the same indemnification. Both classes, ultimately speaking, are alike exonerated from the weight of taxation ; and in the increased price, whether of commodities or labour, the whole burden of it is transferred to the proprietors of the soil.

12. These principles serve to demonstrate, that a tax on commodities falls as little upon capi-

talists and labourers, as either a tax on profits does upon the one, or as a tax on wages does upon the other. It matters not, whether the attempt to reduce their standard of enjoyment, be made by a direct assessment on their income, or by an impost on the articles which they use. Both attempts can be alike resisted, by a resolute adherence on their parts to their respective standards of enjoyment, and their resistance can by each be carried into effect; that of the former class, through the medium of a retardation, or even a diminution, effected on the capital, by means of an expenditure which they will not consent to reduce; and that of the latter class, through the medium of a retardation, or even a diminution, effected on the population, by means of the moral preventive check, whose effect is to sustain that style and habit of enjoyment among labourers, which they will not consent to let down. It is thus that their collective will can maintain for them the level, whether it be a high or a low one, in which they choose to acquiesce; and that this level, it is in their power to uphold, in opposition to all taxes, whether on profits, on wages, or on commodities. They hold in their hands, in fact, the two instruments of capital and population, which they might regulate at pleasure; and thus it is, that every tax, which, without such command, would depress their condition, may be effectually counter-vailed.

13. The general conception is, that dealers can ensure their own escape from a tax upon their com-

modities, by laying it through means of a higher price upon their customers; when that tax is a partial one, or does not reach to all commodities. And the way, it is imagined, in which they do make their escape, is by withdrawing a portion of capital from the trade which is taxed, to that which is not taxed; in which case, the price rises in the former trade, and so transfers the burden of the taxation which has been laid upon it, from the dealer to the consumer. But if this be the only way in which capitalists can escape from taxation, every new tax on commodities, however partial, would be attended by a general fall of profits. The transference of capital from a taxed to an untaxed trade, will of course raise prices in the former, but will depress them in the latter, so as, after an equilibrium is established, to depress somewhat the general rate of profit. If the general rate of profit be ten per cent., and a tax of ten per cent. be laid upon sugar, this would drive off so much capital from the sugar-trade, and so raise its price to the consumer. But if there be no other outlet for the withdrawn capital than other trades, then its investiture in these will bring down their profits, till an equilibrium be established among all the trades, when, after this transference, the general profit on all commodities might be imagined to fall down to nine per cent. But at this rate, profit would be subject to successive deductions, with every new tax laid upon commodities, till at length we might imagine a general impost of ten per cent.

carried round the whole circle of commerce; when, if there be truth in the representation frequently given, all profit would be annihilated, and so all trade come to a stand from the want of inducement to continue it. But this is so manifestly absurd, that there must be some other outlet for the capital withdrawn from the trade that is taxed, than that of vesting it as capital in other employments. Now it can, and often does, find such an outlet, by being turned to the purpose of a revenue, and thus absorbed in the expenditure of capitalists. This is the way, then, in which they have a control over profits, and a refuge from the effects of taxation. They can not only withdraw capital from one business to another, but they can withdraw it in part from all business; and, by thus limiting the extent of its application, they can counteract the whole operation of a tax on their commodities, by such a rise in their price, as will shift the burden of it entirely to the consumers. It will be allowed on all hands, that if taxes can be made in any way to fall upon profit, capital will not *accumulate* so fast as it would otherwise have done; and so *future* prices will be higher than they would otherwise have been. And it is just as obvious, that if, in virtue of taxes, capital is not at this moment *applied* so plentifully as it would otherwise have been, *present* prices must be higher than they would otherwise have been. All we need, then, for the establishment of our position, is the *postulatum*, that taxation, which restrains the future accumula-

tion of capital, will also, if the holders of capital so choose, restrain the present application of it. In virtue of the future increase of capital being restrained, prices will not be so low at some future time as they otherwise would have been. In virtue of its present application being restrained, prices are not so low at the present time as they otherwise would have been. In other words, as without the tax prices would have been so much lower, with the tax they are as much higher; and in these higher prices, the capitalist gets his full indemnification. And the labourer can find his way at length to the same immunity. Both have that state of things within their reach, in which they can alike make head, or stand their ground, against the imposts of government.

14. But though the principle we have now attempted to unfold, is competent to achieve a full immunity for these two classes, from the burden of taxation, the effect may be suspended for a time, in consequence of the influence which certain sorts of taxation have upon agriculture. The most interesting conclusions may be gathered from this part of the subject. We have often said of the extreme limit of cultivation, that it, of all others, is the place where the greatest lessons in economical science are to be learned. It will serve to modify some of our former positions, and lead to the establishment of new ones, if we attend to the effect which the different species of taxation produce upon this limit.

15. First, then, a tax on net rent would not restrain cultivation. It might somewhat retard the progress of it ; but, certainly, there is nothing in such a tax, to prevent the agriculture from being carried as far down among the inferior soils, as if the landlords had been subjected to no such burden. We are quite aware of a retardation that might be caused by a slower accumulation of capital among the proprietors. But capital will arise, and has arisen, in other quarters of society ; so that, in fact, its tendency is to overflow beyond the possibility of its profitable investiture, whether in the business of husbandry, or in any other business whatever. In these circumstances, the cultivation will soon be carried as far with a tax upon net rent as without one. The land that is last entered on, if it pay no rent, is subject to no burden from the tax. The land immediately above it in the scale, does pay rent ; and this rent is subject to a fractional deduction in consequence of the tax. But the recipient, the landlord, will not now refuse to let out this land, because he only gets half a crown, instead of five shillings from the acre of it. Previous to the tax, he does not stop the letting of his land at the point, when it only yielded him half a crown the acre—and neither will he still. The truth is, that in giving over a farm to cultivation, he commits the whole soil of it, with all its varieties, to the management of the tenant, who will cultivate every acre of it that can yield him a profit ; whether or not, over and above this, it yields an

excess, which goes in the shape of rent to the landlord. Let this excess be shared as it may between his landlord and the government, it affects not his operations; and that, because it affects not the capability of the land last entered upon, to give him the return of an adequate profit for the expenses of its cultivation. What this profit shall be depends upon himself, or rather upon the collective will of all the capitalists in the land; who, either by their accumulations can reduce the profit, or by their expenditure can uphold, nay, augment it at their pleasure.

16. Again, a tax upon luxuries, in as far as they are used only by the landlord, would just, in point of economic effect, be tantamount to a tax on the net rent. It would not lie as a burden on the cultivation at all. The domain of agriculture would remain as widely extended as before. All the land lying fully within this domain, would still yield a rent to the landlord; while that placed along the margin, or the land last entered on, would retain its capabilities for yielding a satisfactory profit to the tenant, however the rent of the proprietor might be encroached upon by the demands of the government.

17. But, thirdly, a tax on profit, or even on the luxuries used by those whose revenue lies in profit, has a limiting effect on cultivation. We have already proved how it is, that capitalists can find their compensation, either for a tax upon income, or upon the commodities on which that income is

expended. Should they choose to maintain their wonted establishment, and pay all their taxes to the bargain; this latter payment, by encroaching on the capital, keeps up the profit; and the tax is paid, not out of their income, but out of the higher prices now laid on the commodities in which they deal. This, in the first instance, will operate a contraction on the agriculture, by adding to the price of the second necessities of life, and so adding to the expenses of farm management. And besides, like all other capitalists, farmers will refuse to embark more of capital on their business, than what they can obtain a satisfying return for; or, in other words, they will refuse to enter on the cultivation of land which returns not a certain net profit to themselves; or which enlarges not that profit when its power is trenched upon, of commanding for them their wonted enjoyments, by the imposition of a tax on the articles which they use. This, then, is the effect of a tax which goes to limit the income of capitalists, or to limit the amount of their enjoyment in the expenditure of that income. Farmers will not carry their agriculture so far down as otherwise they would have done. They will stop short at that better soil, out of whose returns they can both pay the tax with the augmented expenses, and remunerate themselves. The agriculture is contracted; or, the effect of such taxes is a lessening of the country's subsistence, a lessening of the country's population.

18. And, lastly, the same is still more palpably and largely the effect of a tax, either on wages or

on any of those commodities which enter into the maintenance of labourers. The land last entered on must at least yield a produce, which can feed the agricultural labourers employed on it, and their secondaries. But by a tax, either on the wages of labour, or on any of those commodities which enter into the maintenance of labour, more than this is exacted from the last cultivated land. It must not only be able to feed the agricultural labourers and their secondaries; but it must at least be able to feed as many more as can be subsisted by the produce of the tax. If a portion of such land require the labour of five agricultural workmen, and they again require the labour of five others to uphold them in the second necessities of life; that land must at least be able to feed the families of ten workmen. But should the taxes, whether on wages or necessities, be equal to a fifth part of the labourers' income; then no land can be entered upon without loss by these five direct labourers, which is not able to feed at least twelve labouring families. All such taxes, therefore, operate to the contraction of the agriculture; and so, eventually, to the diminution of the numbers of the people. And conversely, the remission of these taxes would, as if by the removal of an obstruction, let out the agriculture to poorer soils than have ever yet been attempted. It would be followed by an increase of the means of subsistence; and, eventually, by an increase of the population.

19. A tax then on profit, a tax on wages, or a tax on any of the commodities which are used by

capitalists or labourers, will tell on the limit of cultivation. The imposition of these taxes has the effect of drawing in, and the removal of them the effect of letting out, the agriculture. The immediate effect then of the former measure, were a fall of wages, because of a reduction in the quantity of food, without a corresponding reduction all at once in the numbers of the people; and also a fall of profit from the reduction that would take place, not only in the agriculture of the country, but in all the business of providing for the necessaries and luxuries of a society, whose extent was commensurate to the agriculture; and so a reduction in the business of the country, without a corresponding reduction all at once in its capital. Yet, though the first effect of these taxes is to depress both profit and wages, the ultimate effect in which it settles down, is to depress the revenue of the landlords. The capital will gradually recover its rate of profit, in the process of its own declension; and the population will gradually recover their rate of wages, in the process (we admit a melancholy one) of their own decay. After these processes are consummated, we see the whole of these taxes virtually transferred to the proprietors of the soil. They have, in the first instance, to pay a higher price for the commodities which they use, and the labour which they employ. They, in the second instance, pay, by its being withheld from their rents, the whole addition which taxation lays on the expenses of

husbandry. *These two together*, if there be truth in our argument, *should make up the whole revenue which accrues to government.** But beside mak-

* The position, that all the revenue drawn by the state from the *natural population*, is, in effect, taken from the landlords, is so much the more startling, when one compares the accounts commonly given of the landed rental of Great Britain, with the actual amount of the public income. The rental is frequently estimated at beneath 60 millions annually, whereas the public revenue has at times exceeded that sum, and it is a most natural question, How the doctrine of our text can be made to harmonize with the arithmetical and experimental truth in this matter?

The following statements may serve to explain this difficulty, and to elucidate various of the positions which we have had occasion to make in our reasonings upon the subject

Let us assume 60 millions as the landed rental of the kingdom, and that the public revenue is even as large as 60 millions also. The question is, How, in these circumstances, can it be made out, that the proprietors of the soil would not be losers, if a commutation were made of all our present taxes, and the whole amount were laid on the net rent of land? How is it possible that this rent can bear the burden of a transference, that would seem, *prima facie*, to annihilate the whole wealth of the landlords?

Though our reply to this be on hypothetical data, it will be quite enough to prove what the elements are which serve for an explanation of the difficulty. Let us therefore, still proceeding on assumptions, take the interest of the national debt at 30 millions, and, considering the fund-holders as mortgagees, or as co-proprietors of the land, the whole taxable wealth may, in this view, be regarded as 90 millions.

Let us further imagine the expense of living on the part of the affluent, to have been doubled by the actual system of taxation, or, in other words, that were there no imposts on commodities and other objects, these proprietors of 90 millions' income, could have commanded the same amount of comfort and enjoyment with an expenditure of 45 millions. Then it

ing up for the tax in this way, they have to undergo a distinct and additional loss, in the limita-

is quite palpable that they would not suffer, though all our present taxes were abolished, and replaced by an income tax of 50 per cent. on land and fund holders

But such a tax would only yield 45 millions to government, and there remains 15 millions to be accounted for. According to Mr Colquhoun, whose estimate is understood to be a moderate one, the number of cultivated acres in England and Wales alone, amounts to upwards of 30 millions. We have already seen how, by taxes on commodities, the expenses of husbandry are raised. Let us imagine them to be so raised ten shillings an acre. This makes a deduction from the rent of 15 millions on the whole, a sum, therefore, paid to government by the landlords, because effecting a diminution to that extent in their incomes. This completes the proof, that after taxation has had its full effect on profit and wages, or when these recover their ultimate compensation, they are the land and fund holders, or, generalizing the expression, by regarding the mortgagees as joint owners of the territory, they are the proprietors of the soil who pay all taxes

When asked then, How the landed proprietors, with only 60 millions a year of net rent, can be said to bear the whole expenses of the state, even though these should amount to 60 millions in the year? our brief reply is—First, that in the additional expense which they incur by taxation as at present constituted, they pay annually30 millions.

That their mortgagees, the national creditors, do

also, in the same way, pay15 millions

And lastly, the landlords sustain a reduction of rent,

from the additional expenses which taxation

brings on husbandry, to the extent of15 millions.

Making out of these items the whole revenue of

government, or60 millions

Suppose all present taxes abolished, this would be followed up by a rise of rent to the landlords, to the amount of 15 millions,

tion of the agriculture. The rent of those soils, which taxation may have compelled the farmers to

making their whole revenue 75 millions, which, added to the revenue of the national creditors, would afford 105 millions for the whole taxable income of the country. A tax of about 57 per cent upon this sum, would furnish an income to government as large as before. There would, by this change, be a hardship to the fund-holders, in that they had to pay 57 per cent. on their income, in exchange for the relief of only 50 per cent. in the expenses of their living. There would be a proportional benefit to the landlords, who, in the increased rent of their lands, would receive an addition of 25 per cent. to their income, and, along with it, only an addition of 7 per cent to the exactions of government. This advantage over the fund-holders, may, of itself, supersede the necessity of any such adjustment, as we have suggested in Appendix G between these two classes, on the event of an abolition of the corn laws.

But the advantage to the landlords does not terminate here. They would receive a greater addition to their rent than ten shillings an acre, or 15 millions from the whole of that land which is already in cultivation. The rise of ten shillings an acre, would be afforded from the land *as at present* cultivated. But the same relief from taxes, which permits an additional rent of ten shillings an acre from this land, would also let out the cultivation to inferior land, and allow a more strenuous cultivation over the whole of the cultivated territory. Over and above the 15 millions, which make up all the expenses that taxation lays on the present husbandry, landlords would receive something in the shape of rent from an extended husbandry, that is, both from a new agriculture, which would reclaim a belt of inferior land, and from a more intense agriculture, which may be said to reclaim a stratum of the whole. We might imagine additional dozes of capital, furnishing in succession, nine shillings, and eight shillings, and seven shillings, down to one shilling an acre, in rental to the landlord, as the product of that more intense culture, which, before the remission of our present taxes,

abandon, forms but a small part of this loss;—for they are further compelled by it to abandon

would have been unprofitable. The arithmetical mean of these numbers, or five shillings an acre, would furnish no less than $7\frac{1}{2}$ millions of additional rent to the landowners. And if the belt of inferior land should furnish only half a million, then eight millions of rent, from the extended agriculture, must be added to the 15 millions of additional rent from the relieved agriculture, making an addition in the whole of 23 millions to the rent of land, as the fruit of that commutation of the taxes, the very cautious, but at length total adoption of which, we feel inclined to recommend *

Let us conclude with a short recapitulation, to place in one view before the reader, the benefits which the landed interest would receive from this great change in the financial system of the country.

We have supposed the present income of landlords to be 60 millions, and that the public income is of the same amount.	
Of this the fundholders, though they should pay only 50, instead of 57 per cent would contribute	15 millions
And the landowners paying 50 per cent. also, or a rental of 83 millions,	<u>41½ millions.</u>
Making an income to government (only $3\frac{1}{2}$ millions inferior to what it was,) of	56½ millions.

Even though this sum of $3\frac{1}{2}$ millions, instead of being taken from the fundholders, were taken, by an additional territorial impost, from the landlords, they would still have 38 millions to expend, after the charges of living had been reduced one-half, which is tantamount to 76 millions in the present state of things. In other words, they would have as much benefit by the proposed change, as if, with the continuance of the present prices, they were to receive an addition of 16 millions, or of more than 25 per cent. to their present incomes.

The following extract from Mr. Peironet Thomson's Essay,

* See Appendix, H —On the gradual reform of our Financial System.

those extreme degrees of cultivation, extending to the whole land that is under the plough, which, before the tax, may have been profitable, but which, after the tax, have ceased to be so. They are thus forced to relinquish the difference be-

on the True Theory of Rent, may still further illustrate our argument.

It is said by a writer of name in economical science, that, "the fact that tithes, and other taxes on raw produce, do not form a deduction from rent, but go to increase the price of produce, is obvious from this circumstance, that the tithe of expensive crops, and which require a great expenditure in their cultivation, frequently amounts to *four* or *five* times the rent of the land. The Rev. Mr Harlett, by far the ablest advocate of tithes, and whose authority cannot therefore be questioned, informs us, that the tithe of an acre of hops, raised on land worth forty or fifty shillings an acre, is, after deduction of drying and duty, generally worth from three to four pounds, and he further states, that he had known seven or eight pounds paid for the tithe of an acre of carrot-seed, where the land was not worth twenty shillings¹ In such cases, it is plainly as great an absurdity to affirm, that tithes fall exclusively on the rent of the landlord, as it would be to affirm, that a *part* is greater than a *whole*."

To which Mr. Thomson makes this distinct and decisive reply.

"The whole of this is a confusion of ideas, arising from the *two* meanings of the word *rent*.

"When a tax or tithe is said to form a deduction from rent, this manifestly means, *from the rent as it would be without the deduction of the tax*, and not as *it is after the deduction*.

"Nobody ever said, that the eight pounds, which is the tithe of an acre of carrot-seed, is taken out of the twenty shillings, which is left for the landlord afterwards, but that it is taken out of the nine pounds, which is the residuum, after paying the expenses and necessary profits of cultivation, and that it is because eight pounds is taken for tithe, that only twenty shillings is left for the landlord."

tween the products of the more and the less strenuous cultivation. By drawing in the agriculture, they have not merely to give up a *belt* of inferior land, lying, as it were, without the limit of the cultivated domain; but they have to give up a *stratum* of deeper cultivation within the limit, and co-extensive with the whole length and breadth of the territory. So enormously do the landlords suffer from taxes, which, though ostensibly laid upon others, fall really, and with accumulated pressure, upon themselves. So great would be the advantage, though few or none of them perceive it, if they would but commute all the taxes upon commodities into a territorial impost upon net rent. Capitalists and labourers are the temporary, but landlords are the principal and the permanent sufferers, by the taxes in question. They lose, in fact, a great deal more than the government receives. They at length have not only to pay, in advanced prices and the additional expenses of husbandry together, the full amount of the taxes; but, in virtue of the straitened cultivation which has taken place in consequence of them, they have, to meet the charge with a proportionally less income than they would otherwise have had. Immediately, and ostensibly, these taxes bear hard upon the other classes; but they are truly the landlords, on whom the whole weight of them ultimately falls—and that, not merely with a permanent, but with an aggravated pressure.

20. What disguises the truth upon this subject,

is, that in the immediate or the apparent, we lose sight of ultimate and abiding consequences. The tax upon wages, or upon aught that enters into the maintenance of the receivers of wages, will be felt, (irrespective of its effect in limiting the agriculture of a country,) and is indeed a real hardship on the payer of the tax for the first year of its imposition. A part of what he has got, or would have gotten that year, has been fairly taken from him; and that, before any compensation could have arisen from the larger demand of the government for labour, or the larger ability on their part to support it. But in a single year, we believe, a compensation arising from this source would be made good; when the tax would only be paid by him in appearance, while in reality, and through the medium of his advanced wages, it would be paid by his employer. Still the semblance has the same exasperating effect upon his feelings, as if it had been the reality. And it is most natural for him to conceive of government as his natural enemy, and standing in the way of his comfort; and more especially, when the remission of the tax would operate as substantial a relief to him *for one year*, as he suffered of substantial hardship for one year at the first imposition of it. This remission would prove a real boon to him for one year, and an enlargement beside for a brief season longer, by letting out in some degree the agriculture; when, first, by a fall in the money-price of labour, and then by an increase of the population,

he would soon find, in spite of all that he promised to himself from the abolition, that he was in circumstances of as great straitness and penury as before.

21. And the same holds true of the profit on circulating capital, where the investiture can be contracted immediately, and in one year a full compensation can be had for any tax which may have been laid upon it. But a remission here too would be felt as a boon at the first, and, in as far as it tended to let forth the agriculture, would enlarge somewhat, and for a season, the operations of trade. We are not to wonder, then, if the appetency for immediate relief, and an enlargement however short, since not seen to be so, should create as intense a desire, on the part of merchants and manufacturers, for the abolition of the taxes which bear ostensibly upon them, as if this were to translate them into a condition of sufficiency and ease which was to abide for ever. It is no less the truth, however, that should this remission take place, a larger application of capital at first, and a rapid accumulation of it afterwards, would speedily bring on as limited returns, after the abolition of these taxes, as are experienced at present. It is not the capitalists, but their customers, who pay all such taxes; and, in the long run, they are only the customers who would feel the relief of them being done away.

22. But if the truth lie concealed in the case of wages and profit on circulating capital, it lies under deeper concealment still in the case of fixed capital. When a tax is laid on the profits of the

latter, its investiture cannot be contracted so suddenly, and therefore the effects of the tax cannot be recovered so suddenly, as in the other instances. The cotton manufacturers cannot let down the number of their cotton-mills with the same facility, that certain other manufacturers, who operate with a circulating, rather than a fixed capital, could abstain from hiring the wonted number of workmen. The tax, therefore, is not so speedily counterbalanced in the case of a fixed, as in that of a circulating capital. The compensation is reached at length, and in a course of years,—not by this capital being withdrawn, but by its being suffered to decay to a certain extent without being replaced. It may thus require some years before the proprietors of fixed capital can be reinstated in their wonted gains, when at length the whole burden, both of their taxes and of all others, falls upon the rent of land; whether that rent be given for the original powers of the soil, or for those powers aided and extended by the successive applications of a capital so fixed as now to be immoveable, and which has realized an amelioration on the land that has been the growth of centuries, and will never pass away.

23.* Had the taxes at present under considera-

* It is surely unnecessary to dwell on the obvious effect of such a commutation as we recommend, in augmenting the value of all fixed money-incomes, and so far, in laying a burden, without any equivalent compensation upon the landlords. If the pecuniary allowances to all public servants should remain the same, it were tantamount to an augmentation of their pay, and an augmentation, therefore, of the burden upon the tax-payers.

tion, had no effect in contracting the agriculture, we hold, that sooner or later their whole effect on the clear income of capitalists and workmen, would have been countervailed by a rise in the money-price of commodities and the money-price of labour. But they do contract the agriculture; and the effect of this is, that both these classes take a longer time of reaching their compensation; and that, by a gradual and intermediate process of decay. We should at length be landed in a smaller society, and a smaller capital for the conducting of its business. But, with the same standard of enjoyment as before, among our merchants and our peasantry, we should behold as well paid labour, though now a reduced population; and as well remunerated, though now a reduced capital, as before.

24. We are not insensible to what has been alleged as the likely effect of such a process. It very possibly might give a shock to the standard of enjoyment in both classes; and permanently, or for the space of some generations, degrade it. The taxes in question, by the limitation which they impose on agriculture, do operate, just as a large encroachment of the sea would, or as a blight on the quality of the soil. This bereavement of territory, or this curse of barrenness, would, by a lessening of the country's food, lead, through a midway passage of penury and distress, to a lessening both of the capital and population. But the apprehension is, that the people, thus fami-

liarized to privation, would lose the ideas of comfort, the respectable taste and habits of the better state from which they had fallen. They would undergo, it is feared, a moral change, so that the moral check might, in efficacy and vigour, fall beneath the exigencies of the occasion. There is a certain recklessness, a desperation of character, that might ensue from the more desperate condition in which they shall have been placed; and, while it is admitted, that any enlargement in their means may yield but a temporary augmentation to the comfort of families; the reverse process of an encroachment on their means, may, by an operation purely mental, permanently and irrecoverably degrade them beneath the higher ground which they now occupy.

25. But, practically, we are not called upon to stop at this contemplation. The more cheering alternative is within our reach. In the reform of our financial system, the readiest and most convenient changes are all in the opposite direction. Every commutation of a tax from commodities in general use, to the rent of land, lets forth the agriculture, instead of contracting it. The people are translated into better circumstances; and they may be taught, in the season of intermediate abundance, to have a permanently higher demand for the enjoyments of life than before. They may be raised to a higher status; and of that status they may be enabled to keep the permanent occupation, in virtue of their higher standard of enjoyment. Weie

the economic only followed by the moral enlargement, then, instead of a brief evanescent holiday for the people of our land, the whole platform of humble life may be elevated, and made to sustain an erect, and independent, and prosperous commonalty, to the most distant ages.

26. But we have failed altogether in our general argument, if we have not made good the position, that the economic without the moral, will, in the long run, achieve nothing for our families; affording us only a larger society, but, along with this, a proportionally larger mass of want and wretchedness than before. The successive stretches which are made in respect of room and of abundance will soon be overtaken; whether these proceed from a gradual relaxation of the corn laws, or a gradual remission of the taxes which bear on the mercantile and industrious classes. The full effect of these two measures, even were they perfected, would not secure a greater addition to the food of the country, than we have received during the last twenty years from the natural progress of our agriculture. And who will affirm, that, with our larger population to our larger means of subsistence, we are not in circumstances of as great difficulty, and as closely beset all round with the feeling of straitness and limitation as we ever were? There is no other specific, we repeat, for the economic well-being of our land, than that of moral and Christian education. One vain expedient after another may become the object of the

popular cry, and the popular confidence : and they may yield, too, a momentary ease. But on the great scale of national policy, and with the view to an abiding and comprehensive benefit which shall be felt throughout in society, and last for generations, it will be found, that, without intelligence and virtue among the people themselves, they, one and all of them, are but specious and delusive mockeries.

27. Yet it ought never to be forgotten, that, powerless and insignificant as all merely economic objects are, when there is a reckless and degraded population, they nevertheless form the great moving forces by which the changes that take place in the progress of society are determined. It matters not to the men of the existing generation, whether future generations will have a benefit or not, from the measures they are so clamorously and intensely set upon. The great prevailing appetency with them, is for the present relief, the present enlargement. Though a free corn trade should only ease the commerce and population of the country for a very few years; this is enough to enlist all the energies, both of the multitude and of the mercantile world in its favour. Though the remission of the taxes which bear upon the maintenance or employment of the industrious, be but the momentary loosening of a bandage, immediately followed up by a growth, which will cause the pressure to be sensibly and really as great as before; this does not make the complaint less impetuous, or the

demand for relief less urgent or less influential. Though it be true, that, on the removal of every artificial limit, there will be but the felt enlargement of a very few years, and then as close and besetting a confinement from the natural limit as was ever before experienced; still the impatience under the existing restraints is as loudly expressed by the country, and will at length place government under as strong a necessity for yielding to it. They are not the evils of posterity, nor yet the evils which, in a few little years, will come upon themselves, that practically affect men. They are decided by the feelings of the present, and not the anticipations of the future. They, in fact, have no clear nor correct anticipations upon the subject. The sure and present relief by which all will be eased for a season, and many of them will individually be enriched, is truly all that they care for; and so the cry for emancipation, whether from taxes or prohibitions or monopolies, is as loud and general, as if an everlasting prosperity were to be the result, or a millennium of abundance to all the classes of society.

28. There is a world of delusion in these anticipations. Yet it is quite the wisdom of our statesmen, in this particular instance, to proceed in the current of the general feeling. We are far from the opinion, that *vox populi*, is *vox Dei*; yet, on the present question, it so happens, that the demand of the many, runs in the direction which is best suited, both to their own interests and the

interests of all. Never was there a more fortunate conjunction of a popular, with a sound policy, than in the example before us. Government have it in their power, by a series of commutations from taxes on commodities to taxes on income, at once to ingratiate themselves with the community at large, and to augment that territorial wealth, which forms the source and the sustenance of all other wealth in the country. Doubtless the hopes, the extravagant hopes, of the manufacturing and commercial classes would be signally frustrated; but so also would the extravagant fears of the landed and agricultural classes. The proprietors of the soil would be the only class who should *individually* feel richer in consequence of the change. The subsequent enlargement of wealth amongst the trading classes, would soon be so overtaken by the increasing capital and population, that, *individually*, there would be as great straitness amongst them as before. But then, they could no longer charge their distresses upon government. It would be palpable, that the over-speculation of capitalists, or the over-population of the community at large, were the real causes of every economic calamity that came upon the land. The heart-burnings of political rancour and disaffection, would no longer come to be associated with the depression or the vicissitudes of trade. Government would be relieved from the burden of all that odium which so endangers the cause of order and authority in the commonwealth; and thus nothing, we are persuaded, would contribute more

than the reign of a sound political economy, to sweeten and harmonize the politics of Britain.

29. And it were no small advantage, if landlords were made to bear the whole burdens of the state ostensibly, as they do really; that the importance, the paramount importance, of landed wealth and of the landed interest, would stand forth, nakedly and without disguise, to the recognition of all men. So that it were well for them, if compelled, even though against their will, to pay all taxes. The men who hold in their hand the necessities of life, have the obvious superiority over the men who but minister the superfluities or the comforts. They have the natural ascendancy; and we think it wholesome and befitting, that they should have the political ascendancy also. We hold it the most exceptionable feature in the modern scheme of representation, as being a violation of the rightful and natural order, that the agricultural interest is not sufficiently represented in parliament. We think, that, in partitioning the matter between the landed and the commercial, the supreme importance of the one, and the merely subordinate or subservient character of the other, have not been enough adverted to. But, perhaps, the very violence thus done to the natural propriety of things, may speed the manifestation of the truth upon this subject. The proprietors of the soil have been a vast deal too tardy in learning the lessons which relate both to their own and their country's well-being. It is better that the repeal of the corn

laws, and a reformed system of finance, should both be forced upon them. They will maintain their ground notwithstanding. They may be overborne for a season; but their indestructible wealth will at length appear manifest to all men, as being that which constitutes the main strength and support of the nation. It will even make head against the inequalities of our representative system, and secure for them, in opposition to every device and every provision in the framework of our constituency, the ascendancy in parliament—an ascendancy which will the more readily be deferred to, when it becomes clear as day, that they indeed bear all the burdens of the commonwealth. The lords of the soil, we repeat, are, naturally and properly, the lords of the ascendant.*

* In Sir Henry Parnell's interesting work on Financial Reform, we meet with much that we approve, but with much also that we should feel inclined to modify

In the first place, we cannot sympathize with his zeal for retrenchment, believing as we do, that if taxes were rightly laid, and the produce of them rightly expended, they admit of being most beneficially increased for the best interests of the nation, and with no other sacrifice, than a sacrifice of luxury and splendour on the part of the landed proprietors.

Again: we agree in the desire, that the taxation should be lightened which falls upon manufactured goods, whether at the earlier stage of their preparation, on the raw materials, or at the later and ultimate stage, on the finished articles. But it depends on what the species of commodity is, whether we shall think the tax to be productive of economic injury to the nation. Let the commodity in question be one of the higher luxuries, and, for the sake of greater distinctness to our argu-

CHAPTER X.

ON TITHES.

1. AMONG the questions which now engage us, there is a most important distinction to be observed, between the ultimate and the immediate effect of any given change in the circumstances of a society.

ment, let us conceive that it is consumed only by landlords, who expend a million on the purchase of it. A tax of half a million upon this commodity, whether drawn from the raw or the wrought material, would just have the effect of limiting the enjoyment of the customers to one half of what it was, and, without lessening the means of maintenance of the population at all, would only distribute them differently from before,—one half of those employed in this manufacture being transferred, but as well supported in the service of the state. And, conversely, relief from such a tax would doubtless extend the manufacture, yet in no way extend the comfort of labourers, to whom the only change would be, a change of employment back again from the service of government to that of individuals. In the whole reasoning of the work upon this subject, we may observe no obscure traces of the prevalent, the almost universal conception, that a manufacture yields something more than its own products, and that it not only employs, but supports the people who are engaged in it.

The only taxes productive of economic injury to the nation, are those which make the maintenance, whether of labourers or capitalists, dearer than before. This, in the way we have often explained already, must limit the agriculture, and will proportionally limit the population, and the amount of industry

We have affirmed, that the remission of taxes on wages, or profits, on the commodities used by capitalists and labourers, would let out the agriculture among poorer soils than had yet been entered on, and thus, the first effect would be, a plenty and cheapness of the necessaries of life; and an increase of business, not merely in agriculture, but in trade and manufactures, from the larger supplies that would then be required for the various wants of an increased population. There would be an intermediate season of abundance and prosperity to the poorer classes; and we are not to wonder, if

in the land On this principle, we hold that the taxes on tea and sugar, which enter largely into the maintenance of all classes, do more to lessen the amount of British industry, than any tax would on the raw material of the silk manufacture, which would do little or nothing to abridge the employment of labourers on the whole, however much it might abridge the particular employment of silk-weavers

Further though we cannot agree with the author of this important work, in his views, either as to the additional capital that would have been in the country, but for the national debt, or as to the need of an extreme economy in peace, that we might be enabled to meet the expenses of a war, yet we hail, with cordial satisfaction, all his proposals and views on the subject of an income tax, into which, in fact, all other taxes might be beneficially commuted, and which might, in every case of great and expensive emergency, be carried to such an extent as to supersede loans. It were well if a beginning could be made now, though it were by an imposition so small as of one or two per cent, that, in the first place, all pretext for discontent on the part of the labouring classes might be done away; and, in the second, an end be put to our present system of ultra and unsparing economy.

the taxes which obstruct the commencement of such a season, should be regarded as a burden upon the labourers. But without an elevation in the standard of enjoyment, this season would be temporary. An increasing capital would soon fill up the new fields which had been opened for its profitable investiture, after which the gains of the merchant might become just as limited and precarious as before. An increasing population would soon bear as hard as at present, on the augmented food of the country; and thus the wages and comforts of the peasantry be just as stinted as they are at this moment. Every thing, in fact, short of a moral economic check on the multiplication of the species, and that through the medium of the people's education and improved habits, will turn out but an ephemeral expedient for enlarging their means of enjoyment, and raising their status in the commonwealth. Without this, we shall behold, after an interval of brief prosperity, the very straitening in their circumstances, and hear the very outcries of complaint, that we are now exposed to. There will, in virtue of the change, be a larger, but not necessarily a happier society,—more of absolute produce, both of land and labour, we allow, but a produce shared among a number so much greater, that, we shall at least have the same proportion of individual distress, as we have at this moment. Capitalists will have to complain of as low and precarious profits as formerly,—labourers, of as overstocked markets, and miserable

wages, and frequent visitations of commercial depression and distress, as formerly. Society would undergo a speedy expansion, and a sort of hey-day prosperity be felt during the progress of it. Yet after the transition, and that a very quick one,* had been accomplished, might there in every way be as great a mass of wretchedness, or rather one of larger and more unmanageable dimensions, than before. We cannot, in these circumstances, regard taxes so much in the light of a burden upon the people, or the remission of taxes so much in the light of a deliverance to the people. That it would be followed up by a temporary enlargement in their circumstances, we most willingly allow; but the only class who would reap a permanent benefit, and a benefit placed beyond the reach of chance and fluctuation, are the landlords. They would have the whole advantage of the cheapness, induced both on the articles of private expenditure, and on the operations of husbandry, by the abolition of the present taxes; insomuch, that they would lose nothing, though government should levy the whole amount of the taxes from themselves. And besides, they would have a clear and

* The quickness of the transition would arise from the rapidity wherewith the population advances, upon any augmentation that takes place in the means of subsistence. Suppose that a given reform, whether in tithes or taxes, opened the way for subsistence to an additional million of population, the extreme shortness of the time wherein this can be overtaken, may be inferred from the fact, that from 1803 to 1812, upwards of a million was added to the population

uncumbered gain from all the enlargement which had taken place in husbandry. They would derive a new rent from soils formerly beyond the pale of cultivation; and, what were of vastly more consequence, they would derive an augmented rent from all their old soils, in virtue of the now more strenuous cultivation, which, with the lessening of farm expenses, could be profitably expended on them. The change that we venture to recommend, would spread an augmented richness and value over the whole of their property. It were for their incalculable benefit, could they only be made to perceive it, that all taxes were commuted into a territorial impost. They would then appear ostensibly what they are really—the alone contributors to the public revenue; the only class in the community out of whose wealth the expenditure of government was defrayed. Every pretext, on the score of taxation at least, for the discontent of the other classes in society, would be swept away. The chief inflammatory topics, by which it is that demagogues keep alive the fermentation of prejudices and political antipathies in our land, would be wholly done away; and the lords of the soil would henceforth hold that undisputed sway in the commonwealth, wherewith, by the very nature of their property, they are so rightfully invested. They would prodigiously augment their wealth by the commutation that we now recommend; and they would augment tenfold both their security and their influence.

2. But they are the urgencies of the present, and not the anticipations of the future, which are the great moving forces that operate in society. If the remission of taxes yield but an immediate relief, though only for a short period, to the existing generation, this is enough to create an intense appetency and clamour for the removal of taxes. It explains, and perhaps justifies, the popular outcry against them. But it is a weighty consideration for the legislature, that though, by unsparing retrenchment, they may silence for a little hour the discontents of the nation, there is a gathering pressure that will surely and speedily recur, when the country will be again involved in the same difficulties, and the government, stripped of its efficiency and its means, will be less able than ever to withstand it. The champions of economy are not aware, we think, of the very short-lived deliverance which all their efforts will ever effectuate for the people of the land. It is right that government should be relieved from the odium of being their extortioners or their tyrants; but this might be as well done by a commutation of our existing taxes, as by a simple abolition of them. With every reduction of a tax upon commodities, were there the substitution of a centage on the net rent of landlords, this, without any injury to them, would at once conciliate the affections of the people, and preserve a requisite agency for the service of government in all its departments. It is the way to reconcile the necessary support of government with

the utmost demands of liberalism ; and, in these days of fearful conflict between the two elements of order and liberty, we believe that nothing would more effectually harmonize them than this discharge of the general community from all the burdens of the state, along with the distinct and total imposition of them on the proprietors of the soil. We want the whole weight of our taxation to lie upon them visibly, even as we think that it lies upon them virtually and substantially. They would be indemnified by the cheapening of all commodities, consequent on the removal of the present duties ; and, more than indemnified, they would be rewarded by the new rents yielded to them from the enlargement of the agriculture.

3. Meanwhile, and under the continuance of the present delusion, great public objects might be sacrificed ; and that, too, under the guise of patriotism—and not with the semblance only, but under the real impulse of a generous philanthropy towards the poorer orders. And certain it is, that the remission of taxes would yield an immediate, although a briefly ephemeral relief to them ; while the ultimate and permanent effect would be, to augment the luxuries of the higher classes. The question, Shall we impair, or let down, the needful establishments of the country, that we may ensure the blessings of well-paid industry to the families of the land ? is altogether different from the question, Shall we let down these establishments, that proprietors may live in greater splendour, or be more

deliciously regaled than heretofore? Now, the former is only a question for a moment; and the benefit which it contemplates for manufacturers and workmen, will speedily be snatched from them in the progress of capital and population. The latter is the real state of the question; and it is from it, and not from the other, that we would characterize the policy, and estimate the effect, of that economical mania, which is now so prevalent, both throughout the community, and in the councils of our nation. It is certainly in its abiding, and not in its temporary consequences, that we should be disposed to read the character of any measure which might be proposed to us; and on this principle we hold, that, speaking with a view to the permanent fruit of it, we cannot but regard this work of retrenchment as carrying in it a substantial boon only to the landlords; while, to the working classes of society, it may turn out but the phantom and the mockery of a blessing. We hold it unfortunate, that, on this question, all the seeming, and all the sentiment, should be on the side of unsparing retrenchment; when, in substance and in very truth, there is nothing accomplished by it, but the sacrifice of the most noble, or the most essential of public objects, at the shrine of vanity—the permanent result of it being, not that the poor shall live in greater comfort, but that the wealthy shall luxuriate in greater splendour and effeminacy than before. This will be the final upshot of our present economical reforms; and this the conclusion to the lying

promises of our reformers—the promises, we think, however, not of deceivers, but of deceived. We object not to their immediate demand, but rather desirous, with them, a reduction, or a removal, of our present taxes—only, however, if followed up by the substitution, in their place, of a tax on the net rent of land. Were it rightly perceived, between what two things it was that the real opposition lay, we should feel as if the cause of taxation might be advocated with a more assured countenance, and a more intrepid voice, for then it would become palpable, that the support of public objects might be called for, in the spirit of purest benevolence and of loftiest patriotism; not in opposition to, or with any encroachment on, the comforts of the poor, but in opposition to, and only with partial encroachment on, the superfluities of the wealthy.

4. Tithes, as at present levied, are in the very predicament of those taxes which restrain the progress of agriculture. Like them, they oppose a barrier to the entrance of the cultivator on poorer soils than the last which has been occupied; and like them, too, they prevent the superior soils from having so deep and thorough a cultivation as they otherwise should have had. Under this system cultivation is not so extensive, because prevented from going forth on so poor an out-field as it might; and neither is it so intensive, because prevented from doing its uttermost on the land already under process of husbandry. Without the burden of tithes, fresh land might be taken in, so long as it is

able to feed its agricultural labourers and their secondaries, and yield to the tenant a remunerating profit. But, with this burden, the land is required to do all this, not from its whole produce, but from only nine-tenths of its produce. And so the cultivation is sooner arrested, having now to make an earlier stop, at land from which more is exacted, and therefore at better land. Cultivation makes its last effort at the point where it ceases to be profitable; and this will be all the sooner, when required to do, with nine-tenths of its produce, that which, in a natural state of things, it would have been left to do with its whole produce. At this rate, the cultivation will stop short at land at least a tenth better than that to which it might otherwise have stretched itself. We can offer no computation as to the extent of intermediate soil, between the natural and the artificial limits, which is thus left uncultivated; but certain it is, that, in virtue of tithes, the operations of husbandry must be confined within narrower boundaries.* We are aware that the system is not fully acted on. As far, however, as it is carried, it is an incubus upon our agriculture. And so the immediate effect of its abolition would

* The amount of the contraction suffered by agriculture in consequence of tithes, is much greater than is often estimated. There are calculators who reason on the supposition that we only lost a belt, that is, the out-field and inferior land, which, but for tithes, might have been brought under tillage. Now, in addition to the belt, we lose a stratum, or that additional produce which would be raised over the whole territory from its more strenuous cultivation.

be to enlarge the domain of cultivation ; and, by an increase of food, to diffuse for a time a greater plenty over the land.

5. Still the ultimate effect would be the same from the abolition of tithes, as from the abolition of taxes on the necessities of life. It would lead to an enlargement of the wealth of the landowners ; while to the population, if their standard of enjoyment be not raised, it would lead to no other enlargement than an enlargement of their numbers. We should have a more numerous, but not a better-conditioned peasantry than before. Still it would yield a sensible and immediate, though but a temporary, relief to the working classes. And it is this, perhaps, which forms one of the most imminent dangers of the Church of England. Economists tell us, and in these days of extremity and pressure, that tithes are a burden on the consumer, and add to the price of the necessities of life ; and certain it is, that their doctrine would have the appearance of being experimentally verified, *in the first instance*, by the speedy reduction of price that would ensue on the abolition of tithes. This is quite enough to give the men of the present generation a pressing and a practical interest in the removal of tithes. Nor would it cool their appetency after this reform, though told, that, in a very few years, we should behold a population in as great straits and difficulties as before ; and should find, that, in point of ultimate effect, the measure had operated exclusively and permanently to the enrichment of the

landlords. They, in the long-run, would monopolize the whole benefit of the proposed change. It is the immediate, however, and not the distant effect, which tells on the feelings and wishes of the public; and, certainly, the English church is placed in the awkward and unfortunate predicament, that it stands in the way of an immediate, though but a temporary, enlargement to all the classes of society. This is enough to arouse a mortal hostility against it; and accordingly we find, among all the other adverse influences, the strong expectation of a great economic good in the downfall of that venerable hierarchy; helping still more to exasperate and alienate the minds of a people, not only loosened of all attachment to the church of their forefathers, but bent, we fear, upon its overthrow.

6. And here we cannot but signify our regret, that the doctrine of the economists, upon this question, should be framed in the terms of the immediate and temporary effect that would take place on the abolition of tithes, and not in the terms of the ultimate and abiding effect that would ensue from it. We doubt the philosophy of such a procedure,* and we are quite sure of its mischievous tendency. It is true, that if tithes were abolished, then, on the instant, grain would become lower; and also, that at this instant of time grain is higher than it would have been, had tithes been abolished a year ago. But the actual price of grain is not higher than it would have been, had there never been tithes in the country, or had they been abo-

lished a century, or even but ten years ago. We should have had a larger, but not a wealthier peasantry than now ; the land yielding a greater produce, but the land peopled up to that produce ; and its labouring families, therefore, in the very condition, whether of penury or of comfort, in which we now behold them. The abolition of tithes would just do for England, what the recess, to a certain extent, of the sea from its shores would do for it, on supposition that the new land were shared in proportional quantities among the existing proprietors. The population would flow over on this newly-formed territory, till the whole margin that had been superadded to the island was taken into occupation. Capital would find a fresh field for its investiture ; and a season of intermediate cheapness and plenty would encourage, for a time, the multiplication of families. But who does not see that profit and wages would speedily subside again to their wonted level ; and that, after a bright interval of prosperity, we should behold only a richer aristocracy, but a commonalty as stunted in their means and maintenance as before ? We think it all important to the question of the real incidence of tithes, that the removal of them would but temporarily ensure a higher wage to the labourers ; whereas, it would permanently ensure a higher rent to the landlords. It is this which inclines us to represent them, not as a burden on the people, but as a burden on the proprietors of the soil. We dispute not the force of the temptation,

on the part even of the general community, to be rid of them; seeing, that to them also, a brilliant though brief season of prosperity would ensue from it. Yet, ultimately and everlastingly, the gain would not be the people's, but the landlord's; and we therefore cannot but lament, that science should, in this instance, have lent itself to a popular delusion. That it has practised any unworthy *reticence*, is not to be imagined; but certain it is, that the whole truth has not been told by it. The consequence has been, the semblance of an unnatural coalition between the principles of philosophy and the worst passions of the multitude; and, if not a louder, at least a more formidable and effective outcry than ever, against the greatest and the best of our national institutes.

7. The error of the Ricardo system of political economy on the subject of rent, has been well characterized by Mr. T. Peironet Thomson, as the fallacy of inversion. It confounds the effect with the cause. It is not because of the existence of inferior soils, that the superior pay a rent; but it is because the superior pay a rent, that the inferior are taken into occupation. There does not occur to us any logical term, by which to denominate the fallacy that is now under consideration. But it is not less a fallacy notwithstanding. It confounds the temporary with the permanent; or rather, gives that virtue and distinction to the former, which belong only to the latter. In assigning the incidence of tithes and taxes, the disciples of this

school would represent them as a burden on that class, who can only suffer from them for less than half a generation ; instead of being a burden on that class, who, after the lapse of this ephemeral period, would have to bear their whole weight, and that during the whole currency of their existence. And conversely, it is certain, that if these impositions were done away, the relief would be felt, in the first instance, and for a few fleeting years, by the labourers ; but the old pressure would gather upon them speedily, when the relief would, wholly and for ever, be felt only by the landlords. Science has, in this instance, made a most unworthy descent, from that high ground which she ought never to abandon. She has forsaken the proper objects of her contemplation, which are permanent results, and not brief or fugitive accompaniments ; nor does it extenuate, but rather gives a tenfold aggravation to the charge, that, in so doing, she has ministered new strength to the prejudices of the blindly or wilfully disaffected ; and exasperated still more that fierce and frenzied clamour, which nothing will appease, but the subversion of all authority and order in the commonwealth.

8. It will be the subject of infinite regret to every enlightened patriot, if, for the sake of what at best will yield but temporary relief, and ease them of public clamour and discontent for a moment, our legislature shall barter away the best securities for a nation's safety and perpetual well-being. It will be particularly grievous, if, to lighten a pressure

on the community, that is sure in a few years to recur with all the strength which originally belonged to it, the best instrument for putting into operation the only sound expedient for the amelioration of the people's circumstances, even that of Christian education, shall be stripped of its efficacy, or done away altogether. All other expedients will be found to terminate in mockery. They at best but enlarge the bulk of society, without any reduction, save for a short-lived moment, of the individual or the family distress which abounds in it. They may cause the limit to recede, and to widen somewhat; but they restrain not the pressure within that limit, which is the real cause of a general penury among the poorer orders of the commonwealth. A vessel might be made more capacious than before; but this will not alleviate the distension upon its sides, if there have been no abatement of the elasticity from within. Now the whole effect of the common expedients is, not to ease the distension of the vessel, but only to make it more capacious. Home-colonization, for example, will yield no indefinite harbourage, and yield no enduring relief to labourers. Neither will the devices, however multiplied and ingenious, for finding them employment. Neither will any possible accumulation on the part of capitalists—nor any conversion, we may add, of revenue into capital, as when government lavishes its millions upon public works, for the occupation of the people. Neither will all the openings of foreign trade,

though pushed to the uttermost of its practicable extension. Neither will the remission of taxes—and, lastly, neither will the abolition of tithes. But what the abolition of tithes cannot do, that great institute, which is now supported by tithes, may do. The one expedient but widens the field of occupancy; and that to be speedily filled again, with the same pressure of inconvenience as before. The other does not widen the field of occupancy, but it may do better; for, by the efficacy of its moral lessons, it may lay wholesome restraint on the amount of occupation. And this, not with tyrannic force, but by a mild and grateful influence on the hearts and habits of the occupiers. Through the medium of Christian instruction, a rightly organized church will do more for the economic comfort of the families of the land, than all the other schemes of philanthropy and patriotism put together.* It will indeed be the egregious blunder of men, looking to the wrong quarter for the permanent emancipation and enlargement of our people, if, in grasping for a short respite from their ills, the hold shall be irrecoverably lost of the only instrument by which their comfort and their indepen-

* We are sensible that we here assume the superior efficacy of an *established church*, for the religious education of the people. For a fuller exposition of our views upon this subject, and of the reasonings by which we endeavour to support them, we refer to two former works, the one entitled, “The Christian and Civic Economy of Large Towns,” the other, “On the Use and Abuse of Literary and Ecclesiastical Endowments.”

dence can be ultimately secured. At a time when churches and schools would need to be multiplied, when what may be termed the educational apparatus of our land would need to be greatly extended, instead of being mutilated and curtailed, it bodes peculiarly ill for the future destinies of the nation, that the authority of a reigning school has lent itself to that menacing outcry, which, if carried into effect, would annihilate an order of men, with whose efforts in the cause of popular instruction stand associated the best hopes and interests of England. The difference between the one set of expedients and the other, is this: The object of the former, is to make room for a pressure which yet no expansion can alleviate; the object of the latter, is to restrain and regulate the pressure itself. Under the operation of the one, the people may still be pressing on the limit of the means of subsistence. Under the operation of the other, the people, in obedience to their own taste and sense of dignity, will keep themselves a little way, and therefore comfortably, within this limit. The former alone will never achieve the result of a well-conditioned peasantry, let the physical abundance be what it may. The latter can make good the spectacle of thriving families, even in the midst of scantiest natural resources. It is thus that we behold, in rugged and intractable Norway, a flourishing population, while China, in spite of boundless fertility, labours under the want and wretchedness of its teeming millions. It is thus also that Eng-

land, though enlarged in the culture of its territory, if withal stunted in the moral culture of its inhabitants, may grow in population and penury together; while, whether her soil be liberated from the bondage of tithes or not, she, in virtue of an efficient system of instruction, might realize the blessings of abundance in all her parishes.

9. But we would do both. That is, we would both maintain the church, and relieve the agriculture; and so at once enlarge the room, and, through the medium of religious instruction, keep up that wholesome influence on the habits of the peasantry, which best serves to mitigate the pressure arising from the recklessness and brutality of a neglected population. The clergy, in particular, should rejoice in the church being exonerated from the odium that now lies upon it—should be the first to hail and to help forward the consummation of a measure, by which the hierarchy of England might be extricated from a position so obnoxious, as that of even appearing to stand in the way of the nation's wealth, or the comfort of its families. The reformation of the present system were an incalculable blessing to the Church of England; and that, not merely because it would disarm the hostility of statesmen and economists, but because it would do away the topic of a thousand heart-burnings in every parish of the kingdom. And, in like manner, as we have pled, not for the abolition, but the commutation of taxes; so would we plead, not for the abolition, but the commutation of tithes. The

support of the clergyman would no longer operate as a bar to agriculture, if given either in land, or in right proportion, not to the produce, but to the net rent of landlords. At this rate, the existence of an established and endowed priesthood, would no more obstruct the progress of cultivation, than would the existence of landowners as a distinct order in society. They would, in fact, be joint proprietors along with them, and, whether restricted to their own separate estates, or sharing in the rent of their parishes at large, they would stand completely innocent of all cumbrance upon the soil. It were a relief to agriculture, but a far greater relief to the church. It is only the extension of the one that is limited by the present system, but the very existence of the other is threatened by it.

10. But it ought not to be overlooked, how much the wealth and interest of the landlord would be augmented by the proceeding, even though not only a fair, but liberal commutation were granted to the clergyman. He can well afford to negotiate the matter equitably, for to him the enlargement would be incalculable. By the consequent descent of the agriculture among inferior soils, and, commensurate with this, a more intense cultivation of all the superior ones, he would extract a greater rent than heretofore, from every acre of his property; and thus, (after a full equivalent had been rendered to the church for its tithes,) there would, over and above, accrue much clear gain to himself.

It were hard, indeed, if the alleged prejudice of the church to the other classes of society, were the cause of its overthrow ; when, by a simple modification of its revenues, the general community would receive all the enlargement which it can possibly look for, and the proprietors of land be greatly enriched to the bargain. But should the latter look and long for more than this, they are seeking their own aggrandizement by means of an unprincipled spoliation. We have heard much of the rapacity of a sanctimonious priesthood. But there is danger, and that to the best interests of the state, from another species of hypocrisy ; lest the country should be rifled of its moral and literary provision, and that too under the guise of patriotism—a specious covering for the dishonest selfishness of men, who, in the most emphatic sense of the term, would be the pests and plunderers of the commonwealth.

11. In point of principle and effect, the analogy is perfect, between the commutation of the tithes and the commutation of those taxes which, bearing either on the operations of husbandry, or on the maintenance of those who are engaged in it, add to the expenses of farm management. By the abolition of all such taxes, there is a fully tantamount addition made to the rent ; so that the landlord could, without loss, bear the substitution, in their place, of an income tax upon himself. By the abolition of tithes, there is a corresponding similar addition made to the rent ; and so that the landlord could, also without loss, minister, in a direct way,

as liberal support to the clergyman as before. In both cases, then, an equivalent compensation is thus made out to him. But in neither case does the reaction in favour of the landlord stop here. The removal, whether of the taxes or of the tithes, gives scope both to a more extensive and a more intensive agriculture; to a surplus produce, both from a belt and from a stratum, neither of which had been entered upon before. The landlord obtains not merely an equivalent, but an overplus: first, in the new rent which accrues to him from the reclaimed—and, secondly, in the additional rent which accrues to him from the more improved, territory.

12. In the commutation of tithes, we behold a still more beneficial adjustment to the peculiar circumstances of Britain, than in the commutation of taxes on the second necessities of life. The latter commutation lowers, and that permanently, the money-price of labour; and so would make us still more an exporting country, and land us in a still larger excrescent population, than before. It is true, that it would also extend the home agriculture, so that there might not be a larger proportion of the excrescent population to the natural, after this commutation than before it. But the like advantage which there is in the commutation of tithes, is not subject to this deduction. There is nothing in this commutation that should permanently reduce the money-price of labour; so that from this quarter we are not exposed to any increase

of the excrescent population. We should derive from it, however, a large increase of agricultural produce, and so a large increase of the natural population; which will therefore lessen the proportion of the excrescent to the natural. By the abolition of tithes, there will both be a larger expenditure on the part of landlords than before; and a larger agricultural population, whose second necessities, consisting, in many things, of imports from abroad, as tea and sugar, will require a larger exportation from this country to pay for them. And so, many of those exports which wont to be met by agricultural produce in return for them, may, after this change, be met by luxuries and goods of another description. It is thus, that, with every extension of our agriculture, there may be an increase of British exports, without any increase of our dependence on other lands for the first necessities of life. We may have a greater number of export manufacturers, and yet, in virtue of our extended agriculture, they may be subsisted on home-produce, and so fall into the natural population. The cause of our having an excrescent population is, that, ere our foreign markets are saturated with British exports, the ability of our inland consumers to purchase the goods and the luxuries which come in return for them, has been fully overtaken. When the exports go beyond this point, no other return-import can be beneficially disposed of, but agricultural produce, which goes to form and to subsist an excrescent population. Now every stretch given to

our agriculture, does increase the ability of our inland consumers—whether they be the landed proprietors, who, in consequence, have a larger revenue to spend; or a larger agricultural and secondary population, who, though furnished by an enlarged agriculture with the first necessities, will derive many of their second necessities from abroad. In this way, the return of commodities for commodities is longer kept up, without coming to the necessity of importing food from other countries in exchange for the manufactures of our own. In virtue of the larger exportation that may now be carried on without the return of agricultural produce, it is possible that foreign markets may be saturated with our goods, ere they need to be paid for in that produce. The enlarged agriculture may enable us to raise a sufficient quantity for ourselves. It is thus that the removal of every let or hindrance, in the way of our agriculture, lessens our dependence for food upon other lands; and that the abolition of tithes, in particular, may suffice to absorb our excrescent, either partially or altogether, into a natural population.

13. In virtue of our proposed commutation, the church may be upheld without injury to any economic interest; and it is therefore all the more unfair, that economists have lent the authority of their speculations, to inflame still more the popular hostility against it. Never was there a more unjust or misdirected indignation. The support of a priesthood has been set in opposition to the general

comfort of families. Its only opposition is to the greater wealth and luxury of landlords. The men who do something are eyed with jealousy, because in possession of an interest and a property, which, if not theirs, would but serve to enlarge the affluence and useless splendour of the men who do nothing. Never were the feelings of generous and high-minded patriotism more egregiously misplaced, or the public good more in danger of being sacrificed to the mere semblance of a principle. We often hear of the omnipotence of truth; and that the prejudice of many ages, the deep-laid institutions of many centuries, must at length give way before it. If the ecclesiastical establishments of our land shall be of the number which are destined to fall, and that because the temporalities which belong to them have been pronounced, by the oracles of our day, as an oppression and a burden on the general population, then, instead of truth being their judge or their executioner, they shall have fallen at the hand of cunning and deceitful witnesses, they shall have perished in the midst of strong delusion, at the mandate, and by the authority, of a lie.

14. When power gets into the hands of the multitude, the danger is, that it may be exercised, not for guidance, but for destruction. They generally act by impulse, and not by discernment; and, if only possessed with the idea, or rather with the watch-word, that the church is an incubus on the prosperity of the nation; no voice of wisdom

will arrest the determination of sweeping it utterly away. We hold that a church establishment is the most effective of all machines for the moral instruction of the people ; and that, if once taken down, there is no other instrumentality by which it can be adequately replaced. We are aware that it may be feebly and even corruptly administered ; but the way to rectify this, is, not to demolish the apparatus, but to direct its movements. We should hail the ascendancy of the popular will, if it proceeded on this distinction ; and, instead of deprecating, should rejoice in the liberalism of the present day, did it but know how to modify so as not to extinguish. It is because democracy, instead of a regulating power, is a sweeping whirlwind, that we dread its encroachments. It is hers, not with skilful fingers to frame and adapt the machinery of our institutions ; but, with the force of an uplifted arm, to inflict upon them the blow of extermination. We are abundantly sensible, that the reaction of this tremendous energy, is never called forth, but when provoked by the doings of a corrupt and careless government ; and that, had our national churches been virtuously patronized, and vigorously and well administered in all former days, they had had nothing to fear at this moment from the hostile or vindictive feelings of an alienated people. And yet it were surely their more excellent way, if, instead of passing sentence of annihilation on the church, or ridding it of its essential support, they were simply, by the authority

of their opinion and will, to influence the patronage. Never had public sentiment a greater control over the proceedings of government, than at this moment. And it may well make us despair of any good to society from its merely political ameliorations, if, at the very time when the collective mind of the nation could, in virtue of its rising strength, impress the most beneficial direction on the most beneficial and best of our national institutes—the first use it made of the acquisition, was not wisely to regulate, but wantonly to destroy.

15. We cannot afford to expatiate on the superior efficacy of a church establishment—a lesson which we have abundantly urged and expounded elsewhere.* But never, without the peculiar facilities and resources of such an institution, will there be a full supply of Christian instruction in the land. A practical heathenism will spread itself over the rural provinces; and will deepen and accumulate more and more in our cities. When the people are thus left to themselves, and, in great majority, have forgot and forsaken the decencies of a Christian land, all economic or external resources will be of no effect on the comfort of families, given up, by this time, to profligacy and utter recklessness. It is vain to look for a well-conditioned peasantry, when, brutalized into a state of moral and religious

* In a work, more especially, entitled, “On the Use and Abuse of Church and College Endowments,” beside a few chapters in “The Christian and Civic Economy of Large Towns.”

indifference, they are wholly bent on animal indulgence, and, in reference to all the higher sensibilities of our nature, are in a state of hopeless and immoveable apathy. The expense of a well-organized and purely-administered church, otherwise lavished, in unproductive consumption, on the luxuries of the affluent and the idle, would be repaid many times over, if we, in consequence, beheld among the people a higher standard of character, which never fails to be accompanied by a higher standard of comfort in society. But when once the moral interest is sacrificed, there is no enlargement of the economic interests or capabilities which can possibly make up for it. A church may be so conducted, as to secure and perpetuate the one; and it may be so provided for, as not to trench, by the slightest iota, upon the other. In these circumstances, its overthrow were a most grievous perversion—an act of national madness, having its rightful consummation, first, in the anarchy of the state, and then, in the growing vice and wretchedness of the people.

16. Whatever the coming changes in the state of our society may be, there is none that would more fatally speed the disorganization and downfall of this great kingdom, than if a hand of violence were put forth on the rights and revenues of the Church of England. Even with the present distribution of her wealth, it will be found, that the income of her higher, as well as humbler clergy, has been vastly overrated; and nothing, we believe,

would contribute more to soften the prejudices of the nation against this venerable hierarchy, than a full exposure of all her temporalities, grounded on the strictest and most minute inquiry. And certain it is, that, with the best possible distribution of this wealth, it will be found hardly commensurate to the moral and spiritual wants of the now greatly increased population. If all pluralities were abolished, and the enormous overgrown towns and cities of the land were adequately provided with churches, it would be found, that the whole of the existing revenues would hardly suffice for a requisite number even of merely working ecclesiastics. We cannot imagine a policy more ruinous, than that which would impair the maintenance of a church that has long been illustrious for its learning, and that promises now to be the dispenser of greater blessings to the people, than at any former period of its history, by the undoubted increase of its public virtue and its piety.

CHAPTER XI.

ON THE DISTINCTION MADE BY ECONOMISTS BETWEEN
PRODUCTIVE AND UNPRODUCTIVE LABOUR.

1. SUCH is the influence of language upon thought, that, to the practical effect of mere epithets, may be traced some of the most mischievous delusions, by which the views and sentiments of men have ever been perverted. We hold the definition, by economists, of productive and unproductive labour, to be an example of this ; and that it is not only unsound, when looked at in strict relation to their own science, but pernicious, because of the opposition which it has suggested between the moral and the economic good of society. It has laid discouragement on certain employments most conducive to the well-being, because, according to the established nomenclature, not conducive, but, on the contrary, prejudicial to the wealth of the nation. And as wealth is a term which stands associated, in almost every imagination, with the power, and greatness, and security of the state, as well as with the family and individual comfort of its members, we are not to wonder, if, in respect to such high interests, it has been recommended, as the best policy of a government, to abide and economize to the uttermost, in the maintenance of

unproductive labourers. To this class have been referred, the ministers of religion ; and whose support, accordingly, has been represented as a burden and a bane to the prosperity of the commonwealth ; because a deduction from those funds, which, instead of being lavished on unproductive, might have been expended on the maintenance of productive industry. We hold it, therefore, a proper appendix to our argument on the operation and effect of tithes, that we should bestow some thought upon a definition, which has laid disparagement, not on ecclesiastics alone, but on many other orders of men, whose services are indispensable, either to the public interests of the state, or to the private and personal comfort of families.

2. The wealth of a country has been defined to consist in the produce, by which is meant the *material* produce, of its land and labour ; and they only are regarded as productive labourers, who add to the amount of that produce. He only is a productive labourer, by this definition, who adds by his work, to the value of some tangible, and therefore, some vendible commodity ; a commodity which might be laid up in a store-house, or exposed for sale in a market. A clergyman is clearly excluded by this definition, unless in so far as he shares in the manufacture of that tangible commodity, a volume of sermons, from the class of productive labourers ; and so also is the school-master, and the physician, and the lawyer, and the judge, and the soldier, and the statesman. We

may guess from this enumeration, what those interests of the commonwealth are, at which many of our economists are disposed to look suspiciously and hardly. But their proscription extends further than this; for menial servants, and musicians, and players, and all in fact whose industry has not impressed some marks of its operation, more or less durable, on some marketable commodity, are ranked by them among the unproductive labourers in society. Some of these are certainly not the most useful and respectable of functionaries; and, associated as they are with the former by the common epithet of unproductive, we are not to wonder, if certain of the professions have been viewed with a degree of jealousy by our economic patriots, as creating an obstacle in the way of some great and prosperous enlargement, or as being a heavy deduction from that maximum of good which the country might else have realized.

3. And yet, to expose the utter futility of this distinction, let us think for a moment how much it amounts to. One man's labour ministers to my enjoyment, through the medium of a tangible commodity; another man's labour, ministers to my enjoyment without this intermedium. The confectioner, whose delicious morsel I swallow, is a productive labourer: the musician, whose delicious tune I listen to, is an unproductive labourer. And yet, what economic injury is sustained, though I should pay the one as much for his performance, as I pay the other for his preparation? The grati-

fication to me is equal, or rather greater in the music than in the eatable, seeing that I preferred it. The maintenance to him who administers the enjoyment is the same, whether I have chosen to spend my custom on the productive, or the unproductive labourer. And thus it makes no difference to the wealth of the country, whether the consumers incline more to those gratifications, which come through the vehicle of a tangible commodity, or to those which, without such intervention, yield the same, and perhaps a superior enjoyment. The labourers who are supported by the wealth, are equally well supported on either supposition; and the proprietor who spends the wealth, by being left to purchase that which he likes best, is only permitted the exercise of a liberty, without which, wealth would lose part of its value, and cease to be so desirable.

4. The end of all production is consumption. The *terminus ad quem* of all labour, is the enjoyment of those who buy its products; whether these shall be material or immaterial. This last difference is surely, to all purposes of any worth or consideration, a futile one; and it will be found, that there is an equal futility in any other difference which can be alleged betwixt them. For example, it has been said of unproductive labour, that its effect is momentary, and that all the good of it expues with the performance; whereas, the tangible thing that issues from the other, can be laid up in a shop or store-room, and be there appealed to

as a solid addition to the annual wealth of the country, or recorded among the items of a national inventory. Now it is very true, that when a tune is ended, there remains no equivalent for its price. But the same is true of the coat after it has been worn, or of any vendible and substantial commodity, after the consumption of it is terminated. In process of time, there remains no vestige, either of the productive or the unproductive labour; and, to balance the consideration, that the effect of the one is shorter-lived than the other, it should be remembered that this might be made up by the perpetuity, or frequency of the service. A suit of clothes may last with me a year; and, during the whole of that time, I have a use and an enjoyment in the wearing of them. But, with their price, I may hire for a year, the attendance of a menial servant; and so experience, for the same length of time, the daily benefit and convenience of his labour. And besides, in point of endurance, there is often a vast superiority in the effects of the unproductive, over those of the productive labourer. To the physician, I may owe the continued health of a life-time—to the lawyer, the preservation of my family estate, along a line of successive generations—to the soldier, the independence of my nation for centuries—to the clergyman, the virtue of the people, and the imperishable good of their eternity. So that the effect of the one species of labour, may be as lasting as that of the other; and there is really nothing in this particular charac-

teristic which at all justifies the distinction that has been made of them.

5. In the case of productive labour, there is often a long interval of time between the exertion, and the fulfilment of the object for which the exertion was made. The cloth may have been manufactured many months before it is worn—when, meanwhile, it occupies a place among the goods of a warehouse, and might, during that period, be registered as one of the constituent parts in the actual wealth of our nation. But surely there is nothing in this delay, which intervenes between the performance of the industry, and the whole purpose for which the industry was set agoing, that can at all attach a preference to the labour which ministers enjoyment through the medium of commodities, over that labour which, without such a medium, still ministers enjoyment. The gratification arising from music, comes immediately on the back of its execution—the gratification that lies in the use and consumption of a manufactured article, might not commence for a great many weeks after the completion of it. If there be any difference here, it should be in favour of that process where there is the least delay between the aim and the accomplishment, or where the labour, and the thing laboured for, come the nearest together. When a process of busy action is entered upon, which is to terminate in the attainment of some object of desire, it is surely better that we should have to wait a short, rather than a long time for it. The power

of realizing any fulfilment that our heart is set upon, is all the more valuable, the more speedily that we are able to realize it. So that, on this particular ground, there seems no superiority in productive labour, according to the economic sense of the term, over that which is unproductive.

6. It would be impossible to maintain this distinction against the many examples which might be alleged in opposition to it. A manufacturer of fire-arms, by the definition in question, is a productive labourer. The soldier who uses the fire-arms, and but for whose use of them they would never have been fabricated, is an unproductive one. The cook within doors is unproductive. The confectioner out of doors, though the very same work is done by him, would be recognized and honoured as a productive labourer. Yet both impress additional value on a tangible commodity—only, in the former instance, we want the shop; and so, in the hands of the cook, it is not, as in the hands of the confectioner, a vendible commodity. A singer, or even a performer on a musical instrument, is unproductive. But the maker of the instrument is a productive labourer—and should it be an instrument that can perform of itself, such as a musical automaton, then we should have a clear addition to the wealth of the country, without the alloy or the deduction of any unproductive labourer having at all to do with it. It is thus we should imagine, that a thousand manufacturers of *Æolian* harps, must be regarded with all complacency by our

economists, as undoubted contributors to the material produce, which, by their definition, is tantamount to the wealth of the nation. But should the demand be changed from inanimate to living music, and the thousand artificers be transformed, of consequence, into so many vocal performers—we must suppose, that at this transition a reduction of wealth has taken place, although all the labourers are as well maintained, and all the employers are better pleased than before. We have already stated, that a preacher of oral sermons is unproductive—but that, should he publish a volume of written sermons, he forthwith stands out in the capacity of a productive labourer. In short, without regard to that which is nevertheless the real *terminus ad quem* of all trade and manufactures, even the enjoyment of consumers, and without regard to the reward or maintenance of those who are engaged in them, for the maintenance is in every way as liberal, whether they are employed in the capacity of productive or unproductive labourers—this definition proceeds on some mysterious virtue which is figured as residing in the mere vehicle of the enjoyment. Unless that vehicle be a piece of matter, wealth, and all the blessings of which the term is comprehensive, are conceived to be somehow impaired by it. In a word, they cannot conceive how wealth should be in any thing, unless it be a something which the hand can handle. Without this, all is unsubstantial in their eyes. And though, by one mode of expenditure, health, and security, and

virtue, and education, and justice, and science, are purchased for the community, at the hands of so many unproductive labourers; yet if, by another mode of expenditure, other blessings, however inferior, but unlike to these, laid up in packages or bales of merchandize, are purchased from the hands of productive labourers—economists there are, both in and out of parliament, whose whole philosophy would enjoin them a contempt for the any nothings, and a longing appetency for the bales.

7. The principle against which we contend, assumes a different form, in the argument at least, if not in the convictions of those who admit the value of a work, even though done by unproductive labourers; but who desiderate more of that work for the same money, or, in other words, that the work shall be done more cheaply. With the principle of this demand we have no quarrel. It applies equally to both kinds of labour. It is just as desirable that the machine of a literary or ecclesiastical establishment should become more effective, as that a stocking-machine should become so; and if, in virtue of this, either enough of literary and religious instruction can be rendered, or enough of stockings can be made, for less money than is now expended on these objects, the community would just have the more to expend on other objects, and the enjoyments of human life be multiplied of consequence. We do not fear to bring either our church, or our schools and colleges, under the examination of a tribunal, that shall adopt this prin-

ciple, and shall honestly proceed on it. We believe the conclusion would be, that the educational apparatus of our island, whether in respect of Christian or literary tuition, was defective both in extent and provision; and we should hail it as a subject of patriotic congratulation, if, at the expense of an inroad on that wealth which is now lavished on material objects of expenditure, more ample allowances were given for the support of religion and learning, even though it should lead to the multiplication of the unproductive labourers in our land.

8. In this preference of the productive over the unproductive labourer, there lies a subtle delusion, by which the political economy, both of many a student and of many a statesman, is pervaded. One distinction between the two species of industry is, that the products of the former cannot, from their very nature, be tangibly laid hold of, and in this shape be made the subjects of any commercial transaction. Whereas the products of the latter have generally an intermediate stage to pass, between the labourer and the consumer, during which they are exposed to sale in a shop, or have to undergo, in some form or other, a process of marketing. Now they are the shop and the market, which, in the eye of many a politician, are the great symbols of national prosperity. A work done by a cook within doors, is not so gratifying to their patriotism, as that done by a dealer in pastry without; because it deprives them of the agreeable spectacle of so much trade. There would not be

the same amount of ostensible buying and selling under the one arrangement as the other. It matters not their being told, that the consumer may be better served at the hands of the unproductive, than at the hands of the productive, or, at least, served in the way he himself likes better ; and that the labourers, under either system, are equally well remunerated for their industry. In addition to these two interests, which appear to be the only essential interests in the transaction, there is another, which we should like our mercantile economist distinctly to define, but which, we are sure, he will find to be impossible—because really it has no existence, save in his own shadowy imagination. He cannot state any rational difference to our national wealth, between what is contributed by the well-paid manufacturer of a musical instrument, and the equally well-paid performer on that instrument ; or even though, without an instrument, he should only perform with his own voice. Under either economy, the labourers are equally well paid ; and, under the actual economy, the employer is better pleased. It is a most unmeaning preference, that, under the one, there is an apparatus of counters and customers, which is wanting in the other. There is a deep-laid imposition here, and by which the gravest of our legislators have often been bewildered—when idolizing trade, as if it were the fountain-head of a wealth, to which it owes its own dependent and subordinate existence ; and which, apart from its own commodities, or rather, from

the gratification which consumers have in the use of these commodities, has not one earthly interest belonging to it, that either patriot or philanthropist ought to care for.

9. But more than this. The distinction that we are endeavouring to expose, stands associated with certain notions on the subject of capital. Material products are conceived to have this advantage over immaterial, that they alone can be laid up as capital, and in that capacity be made to subserve the object of future production. This is not exactly true. The immaterial products of security wrought out for us by our warriors, or of health by our physicians, or of the people's equity and sobriety by our clergymen, subserve industry and the enjoyment of its fruits, just as any of those commodities do, which may have been accumulated for the support of future labour. And besides, there is no advantage in the laying out of capital, if that capital is not to be replaced, which it only is by the expenditure of consumers. The outlay incurred in production by the one party, is ever regarded as wasteful and undesirable, unless it be met by an adequate return made in the expenditure of the other party. Now it so happens, that this expenditure may as effectually replace capital, in the case of unproductive, as in that of productive labour. A master tailor may not have more capital, than the master of an orchestra who heads a party of musicians. The capital by which the one is enabled to pay his journeymen, and to uphold his very scanty imple-

ments of labour, is often not so great, as the capital by which the other is enabled to pay his performers, and to uphold the apparatus of an opera. So that the expenditure by attendance on a place of entertainment may, in fact, subserve the maintenance of a larger capital than the expenditure incurred by the purchase of clothes. But the short way of disposing of this consideration is, that it serves no earthly interest or end, to accumulate capital beyond the power or possibility of its being advantageously invested. Up to that point, there is no fear of capital being maintained. This is a matter which regulates itself. To give a preference for productive over unproductive labour, that the products of the former may be laid up in store for future production, is a process which must soon run itself aground, and, altogether, the interest in question is of vastly too secure and independent a character, to require that we shall proceed on any arbitrary definition whatever, for the purpose of upholding it.*

10. Altogether, then, the distinction seems to be nugatory in principle; and withal, mischievous in application. The agricultural class, or those who are employed in raising the first necessities of life, are all of them, in the sense of the definition, productive labourers. The secondary are chiefly, though not exclusively so; there being a demand,

* The reader will perceive that the error involved in this definition, is connected with the error that capital admits of indefinite accumulation.

even among our general population, for education, both in Christian and in common scholarship; and which they frequently pay out of their own wages. And who can deny, that, by this part of their expenditure, even though it goes to the support of unproductive labourers, they secure a blessing to the land, which nothing could compensate, if their revenue were wholly laid out on tangible commodities? And then, as to the disposable population, it positively signifies not to any economic interest which is worth the caring for, according to what proportion they shall be divided into productive and unproductive labourers. It altogether resolves itself into the taste and inclination of their employers; and to this, it should be altogether left. It were a deduction to them from the value of their wealth, if not at liberty to spend it in the way they like best. In as far as they have a preference for commodities prepared by our own countrymen, their demand will go to sustain home manufacturers; and we shall behold so many of the disposable population engaged in this species of industry. In as far as their preference is for the luxuries of other climes, we shall behold so many more of the disposable population engaged in the business of shipping, or of export manufactures, wherewith to purchase commodities from abroad. And in as far, again, as their preference is for a retinue of servants, or for theatrical amusements, or for the education of their families, or for enjoyments of any sort, yielded directly and without the

intervention of material products; in so far will the disposable population consist of those who are termed unproductive labourers. What the proportion shall be, is a matter of no signification whatever, to any one interest which should enter into the computation of national prosperity or national greatness. It will not affect the extent of the disposable population. It will not affect the amount of comfort or abundance diffused throughout the members of it. It will neither affect the revenue of government, nor its power to enlist what proportion it may, of the disposable population, into the service of its own establishments. It will neither affect the prosperity nor the numbers—it will only affect the employments of the population. And in whatever way the expenditure of consumers is apportioned, between productive and unproductive labourers, while to them a maximum of gratification is secured by their being suffered to spend their wealth as they will, we shall behold, under all the possible varieties of their taste and demand, the state equally powerful and flourishing, and comprising within its limits as great a number of thriving families.

11. We have entered at so much length into this argument, because we think the political economy of our day bears a hard and hostile aspect towards an ecclesiastical establishment; and we have no doubt, that to this, the hurtful definition of Smith has largely, though perhaps insensibly, contributed. The services of a church are mainly performed by

unproductive labourers; and, from this single circumstance, we can imagine, on the part of a deluded patriotism, many a secret wish and aspiration for its overthrow. It is therefore of all the more importance, to expose the futility of the distinction that has been made upon this subject; and, setting aside, as a frivolous and unmeaning accessory, the presence or the want of a tangible intermedium, by which the good of any service is conveyed to us, we would found the question between one distribution of employment and another, wholly and exclusively, on the nature and magnitude of the good itself. We should not be afraid to rest upon this issue the cause of a religious establishment, even though the spoils to be gathered from its overthrow, were capable of being diffused, in the form of a secure and permanent increase, to the physical comforts of the population at large. But we hold ourselves to have a far mightier argument on our side, in that the result of such a catastrophe were but the enrichment of our landed proprietors, and that no appropriation of the wealth of the church can prevent this from being the ultimate destination of it. Even though allotted in the first instance to the necessities of the state, and followed up by the remission of taxes, this, after affording scope for a season to the increase of population and capital, would but pour the wealth of our ecclesiastics into the bosom of the landed aristocracy at the last. We have already explained how that scope might be afforded, and yet the

church be upholden in all her temporalities ; and after this, on weighing the only real terms of the alternative, a moral good to the community against a large accession to the splendour and luxury of our landlords, we cannot hesitate for a moment on the question, whether the exchange of the one for the other would prove a bane or a blessing to our nation.*

12. After all, then, the property of the church has created but a division of wealth, and not a diminution of it. The landed proprietor may still complain of its existence, but with no more reason than the owner of a thousand acres has to complain of the contiguous, but separate estate of a hundred acres lying beside him, and which he should have liked to be in his own possession, rather than in that of another man. The clergyman stands in the same relation to the landlord, that

* We gladly observe in the pages of M. Say, a recognition of immaterial products, as forming an addition to the wealth of a country. The revenue of our landlords, in as far as it is spent by themselves, is absorbed in unproductive consumption. The taxes and the tithes which they pay, go to the support of public functionaries, or are consumed productively, and if, on the one hand, the former be paid to a well-administered government, and, on the other hand, the latter be commuted and paid to a well-administered church, then taxes and tithes, (the very reverse of what has been ascribed to them,) go to enrich, and not to impoverish a nation. The civil, and military, and ecclesiastical labourers, give a return in their services for a revenue that would otherwise have been expended without a return, and the value of these services forms a clear addition to the amount of national wealth.

the small proprietor does to his neighbouring large one ; but with this mighty difference to the public good, that his property involves in it an obligation of duty, whereas the other is in a state of simple ownership. There are some who hold that the property of the island is not enough divided, and complain of the large estates that are vested in single individuals or families. The institution of a church, even apart from the service which it renders to society, is at least a mitigation of this alleged evil. But its main vindication is its usefulness. The clergyman is bound to do something for his share in the soil. The proprietor to nothing. The public would be gainers, if still more of the county's wealth were placed in the condition, of having a duty and a service attached to the possession of it ; or, in other words, in opposition to the popular and prevailing cry, we hold, that too little of the produce of the land goes to the support of functionaries ; and that, of course, the mere proprietors, the *nati fruges consumere*, are allowed to reserve too much of it.

13. The united expenditure of the clergy and the landlords, gives as great an impulse to trade, and as large a support to labourers, as would the entire expenditure of the landlords, had there been no clergy, and our ecclesiastics been so many small proprietors. That, then, is an interest clearly not affected by the institution of an established church. Apart from such a provision, its revenues would have yielded so much enjoyment to possessors of

land ; but, in their present state, they yield as much enjoyment to the holders of our ecclesiastical benefices ; so that, looking to the subject under this view likewise, there is no loss incurred by the system for which we are contending. But again, landlords are under no positive or prescribed obligation, of rendering any service to the community for their share in the produce of the soil. Clergymen are ; and though they should fall short of discharging their whole obligation, yet, should they discharge it in part, and so as that some positive balance of good to society is done by them on the whole, to that extent is society benefited by the church, and to that extent would society be a loser should the church be overthrown. There is not, to use the language of some of our economists, unproductive consumption. That of the landlords is. Let immaterial products be included along with material, as Say and others would, in the enumeration of a country's wealth ; and the institution of a church may serve, not to impoverish, but to enrich a community. It is the means of turning so much unproductive into productive consumption. Without a church, the whole of our ecclesiastical wealth would have been in the hands of those who give no return for it. With a church, we have the returns of all its usefulness—its theological learning—the protection which it affords against a desolating infidelity—the service which it renders to the morality of the commonwealth—and, above all, to the eternal well-being

of the individual members who compose it. These are not the less substantial, that they enter not into the common definition of wealth, as consisting in the tangible produce of land and labour. Let tithes and taxes be but commuted as they ought, and, in the hands of a purer church and a purer government, it will become quite obvious, that they do indeed augment the national wealth, in the best sense which can be annexed to the term—turning that produce, which would otherwise have been idly or unproductively consumed, into an instrument of the highest benefits and blessings to society.

CHAPTER XII.

ON THE LAW OF PRIMOGENITURE.

1. ANOTHER of the vague imaginations for the relief of the country, and for the diffusion of a greater comfort and abundance through all its classes, is the more equal diffusion of property. The expenditure of the landlords seems by many to be regarded in the light of an abstraction from the maintenance of the other orders of society—as if this very expenditure did not consist in a transference to the industrious, of sustenance and support for their services. In spite of this obvious consideration, there does obtain the expectation of a great enlargement, to ensue from the abolition of the law of primogeniture. And certain it is, that, in the politics of our day, there is a growing and gathering strength of opposition to the system, which guarantees our landed aristocracy in the possession of their ample and unbroken domains from one generation to another. We have already said, that the advocates of a more equal partition of the land, should, on this ground at least, befriend an established church, by which, at all events, one species of partition is carried into effect. This, however, is in no way our argument for such an institution—it being of far less importance in our

view, that property should be more equalized, than that property should, if possible, be placed to a greater extent than now in the state of having a public service and obligation attached to it; and that, consequently, less of it should be left in the state of simple and unconditional ownership. We happen not to think, that a more equal division of the land is in itself desirable; and far less, that the indefinite subdivision of it would prove a blessing to the country. Let us shortly contemplate the effects of such a process, in the train of which, if once entered on, there would follow both political and economical effects of the utmost magnitude. It is not only, however, because of these that we invite attention, but because we hold it to involve a question of professional importance, as bearing on the subject of the incomes allowed to ecclesiastics, as well as to all the other public functionaries of our land.

2. The effect, then, of an indefinite subdivision of the land, would be to lessen indefinitely, not the population on the whole, but that class of them which goes by the name of the disposable.*

* We must not, however, ascribe to the largeness and integrity of its landed estates alone, the very great proportion which the disposable bears to the other two classes of labourers in Britain. Both its more perfect system of leases, and the superiority of its methods and machinery, whether in farm-work or in manufactures, contribute to the same result. They cause that, by means of a much smaller agricultural and secondary population, the same amount of food is raised in Britain than perhaps in any country of Europe, leaving a greater sur-

3. The landed proprietor, in expending that surplus produce of his estate, which goes under the name of rent, must himself be upheld in the first and second necessities of life; and so far must he draw on the services both of the agricultural and the secondary population. But whatever he is able to expend over and above, he, by our definition, expends upon luxuries, and in so far he upholds a disposable population, who, by our definition also, are employed in preparing them. Let us imagine him able to expend the maintenance of four such; but that, in the next generation, his estate is divided into two parts, each having a separate proprietor. The surplus produce has now

plus of hands for the service of the affluent in the preparation of luxuries, or for the services of the state. This is the real secret of a power and political greatness so much beyond the absolute population of our island. It is not by its absolute, but by its disposable population, that the strength of a nation is to be estimated. We are much behind France in respect of the former, but not of the latter comparison.

And as we have adverted to the varieties of land-letting, we would only remark, that there is surely nothing in these which cannot all obscure a truth that so announces its own evidence, as the utter incapacity of land which but feeds its agricultural and secondary labourers, for yielding a rent in any shape. If, over and above this, its cultivators can render personal services, or pay taxes, or afford part of the produce to their superiors, these are not the same in kind as the money rents of Britain, but still they are varieties of rent, and proceeding too from the same cause—from a surplus produce, or a superior fertility in the soil, over that which could but remunerate the expenses of its husbandry.

to maintain two proprietors in the first and second necessities of life, instead of one. It was formerly divided between the essential maintenance of one proprietor, and four labourers of the disposable class—it will now be divided between the essential maintenance of two proprietors, and three labourers of the disposable class. At this point one of the disposable population has been withdrawn, and a proprietor has come in his room. At the next descent, should the same rate of subdivision hold, we shall have four proprietors on the land which originally belonged to one; and, instead of four of a disposable population, attached by service to the property, there will only remain one of that description. At the next descent, the whole of the disposable population, formerly attached to the owner of the property in question, behaved to disappear. The surplus produce would not, in fact, be equal to their maintenance in the first and second necessities, or to what may be called their essential maintenance—and their owners behaved to help out their support by entering on that part of the gross produce which is detained for the expenses of the husbandry; which they could only do, by sinking, partly into the agricultural, or partly into the secondary class of labourers themselves. The tendency of such a system, then, is to extinguish the disposable population, in as far as their services are attached to the proprietors of land, and to substitute a merely agrarian population in their room; each perhaps labouring at the

husbandry of his own scanty portion, and it to be frittered into still smaller shreds and pendicles with the rising up of the next generation. The disposable population would not be annihilated, even with the farthest consummation of such a process. There still behoved to be so many attached to the service of capitalists, who, in expending their profits, would be enabled, as at present, to purchase the luxuries of life for themselves and for their families. Mainly, however, our landed aristocracy would disappear; and, whether as it respects the state of society, or the direction and distribution of employment among the people, we know not how a greater revolution could be effected, on the internal economy of our nation, than by the abolition of the law of primogeniture, and the enactment, in its place, of a law of equal inheritance among the children of a family.

4. Now, assuming, what we surely need **not** prove, that the agricultural produce of a country, in this comminuted state, is not, and cannot be greater, than when the land is parcelled out into ~~sizeable~~ sizeable and well-stocked farms; it will be obvious that there is no security whatever for the better economic condition of an agrarian, than of a disposable population. The moral preventive check might operate with equal efficacy in both; and, if this check be wanting, the distress of both is equally unavoidable. The want or the well-being of a nation, resolves itself exclusively into this; and, apart from this, there is no expedient which

can be devised, that will ultimately and permanently serve to elevate the comfort of the poorer orders. We have indeed many experimental symptoms within our reach, of the misery incidental to a mere agrarian population. In Ireland, the degradation of the peasantry has been ascribed to an indefinite subdivision in the occupancy of the soil; and the very same result may be looked for in the indefinite subdivision of its ownership. In those country hamlets, the erection of which has been encouraged by the attachment of a slip of land to each of the tenements, what an amount of want and of wretchedness is often realized! A headlong deterioration in the circumstances of the people, is just as possible and likely under this agrarian system as any other. Nothing, in fact, will save the community at large from the miseries of an oppressed and straitened condition, but an elevation of the popular character and mind; and more especially of this expedient of family equalization may it be said, that while, ultimately, it cannot restrain the people from descending to as low a grade as they would have done under any other economy, it, at the same time, weakens to an incalculable extent the general interest of the state; besides preventing the formation, or the increase, of certain other and subordinate interests, which best serve to grace and to dignify a nation.

5. What we mean by the general interest of the state, is the interest which lies in the amount of its public revenue, and its consequent command

over the services of the population. It is quite evident, that all those enlisted in the direct service of government, provided that their whole time is given to it, must belong to the disposable class; as, with a given population in the country, and a given standard of enjoyment among them, neither the agricultural nor the secondary classes can possibly be tenched upon. It is out of the disposable population, then, that a government draws its soldiers, and sailors, and civil servants, and all the agency of its various establishments, on the supposition of this public service being, not their occasional, but their perpetual occupation. Even then, before we have entered upon any financial consideration, it must be obvious, that whatever limits the disposable population, lessens the power of a state to extend its permanent establishments. It may command the temporary service of all its citizens. It may compel each man to be a soldier; and thus enact a composition of professions between the civil and the military. But it cannot, consistently with the full benefit that lies in the separation of the professions, or in the division of employment, it cannot have such numbers at its disposal; when, by any cause, an abridgment has taken place on the disposable population. The landed property, which has four disposable labourers attached to it, can be so taxed, as to place a greater quantity of labour under the control of government, than when, by its first division, the number of such labourers is reduced to three, and

still more, than when, by its second division, the number is reduced to one. Or, to exhibit the same thing in money, if an estate be worth two hundred pounds a year to its one proprietor, and fifty be allowed for his essential maintenance; then, the sum of a hundred and fifty pounds may be regarded as the taxable fund that is yielded by the property. But, after it comes into the hand of two proprietors, there must be the deduction of a hundred pounds for their essential maintenance, and the taxable fund is thereby reduced from a hundred and fifty to a hundred. It is thus, that, by every step in the process of subdivision, a reduction takes place in the amount of that produce which government can reach by its taxations. A territorial impost could not raise so much from a country divided into small as into large properties, without a far greater sense of depression and discomfort on the part of its owners. And these may at length be so multiplied, that, reduced to the necessities of life, they could pay no such imposts at all. It is thus, we think, that the law of primogeniture stands essentially connected with the strength and power of a nation; and that every government is sure to wax feeble, under a system by which the land crumbles into fragments. At every new subdivision, the disposable population is lessened; and just because the surplus maintenance, which went to uphold them is lessened—there being always a greater and a greater proportion of it absorbed by those agrarians, who are left to

multiply without limit, on a soil that will soon be unable to sustain them. The people, individually, are not more comfortable ; while, collectively, their strength and greatness must decline. France, under her present system, and in spite of the convulsive efforts made by her in seasons of great public excitement, has entered, we believe, on a sure process of decay ; and, without a more comfortable peasantry than before, will she sink in the long run, beneath the pre-eminence once held by her among the nations.

6. We are aware that, generally, it is not by an income tax, that the public revenues, in the different states of Europe, are raised. Still the argument holds, in as far as they are raised by a tax on the luxuries of our landed proprietors. This is a source of income to government, that is perpetually lessening, under the system of territorial division. And its tendency is to land the nation in that state, when nothing will remain for taxation, but the profits of capital, and the wages of labour, and such commodities as enter into the consumption of capitalists and labourers. We have already explained, how the effect of such taxation, is to limit the agriculture, by causing it to stop all the sooner, in its progress downward among the inferior soils ; the last soil entered on, behoving to be of such capability, as will not merely yield a satisfying remuneration to the capitalists and labourers, but yield, over and above, the payment of all the taxes to which the capitalists and labourers

are exposed.* One great recommendation that we insisted on of a tax upon net rent, is, that it lays no such impediment on the progress of cultivation; insomuch, that if the whole of our national revenue were drawn from the landlords, they would not only have a full compensation in the cheapness of the commodities used by them; but, in addition, they would have an enlargement of their income, by the agriculture being relieved of its present obstructions, and let out to the uttermost limit of which, apart from taxation, it is capable. There is thus a double infliction attendant on an indefinite subdivision of the land. It necessarily confines the taxes to such objects, that they oppose the extension of the husbandry, and thus limit the natural produce of the country; while it lessens that proportion of it which can be made available to public or national objects. In counterpart to this, there is a double benefit in that

* So much do we hold this to be the truth, that, if there is soundness in our principle, it is still the land which yields all the taxes, even after it may have been so subdivided, as that all which bears the semblance of rent shall be annihilated. The mere capitalist finds a refuge from taxation in higher profits, and the mere labourer in higher wages. It is the residuum of farm produce, over and above that which defrays the natural expenses of farm management, that pays all the public revenue, and it is conceivable, that, in that payment, it may be so wholly absorbed as to be lost sight of altogether. That land should be able to sustain this burden, it must be of a superior quality to that which forms the natural limit of the agriculture, or, in other words, the agriculture must stop at a higher point of fertility than it otherwise would do.

system of larger properties, which would admit of the revenue of government being wholly territorial. It would both enlarge the national wealth, and enlarge that proportion of it, which might be devoted, through the means of taxation, to any of the objects of patriotism. The nation might become both individually richer, and collectively stronger than before.

7. This double benefit speaks strongly in favour of the law of primogeniture. Under this law, and with the system of larger properties to which it gives rise, there is room for a higher territorial impost, insomuch that the whole public revenue might be raised by a tax upon net rent. And were the method resorted to, of making the centage of imposition higher as the income was higher; a much greater amount could be levied for the public service, with less of individual hardship to those on whom the taxes had been laid. The proprietor of ten thousand a year could not only part with a larger sum annually, but with a larger proportional sum, than the proprietor of a thousand a year. ~~But~~ this is not the only advantage of the system for which we are contending. Government can not only obtain, in consequence of it, a greater fraction of the country's wealth, but the wealth itself becomes absolutely greater. Every other tax but one on net rent, more especially if laid on articles of general consumption, contracts the agriculture of the country; and, along with it, the dependent and subordinate interests of the population,

and the trade and the manufactures. With the commutation of all general taxes into one on net rent, every artificial limit to the extent of cultivation is done away, and the wealth of the country is carried forward to the uttermost of its capabilities. Government is not only enabled, first, to raise a larger proportion; but, secondly, to raise that larger proportion from a larger subject. This is the way by which to draw the maximum of public revenue, for the benefit of all public interests; and that, by an imposition on landlords alone, without even so much as the semblance of hardship on the community at large; a way, by which taxation may be carried, if necessary, beyond all former example, and without hurt or heart-burning to the general population.

8. The topics of popular invective often cross each other. The loudest against the burden of taxation, are also the loudest against the law of primogeniture. Little do they know, that this law might be the instrument of a great and general immunity to the people; that, by the help of it, taxation, though levied and expended for the benefit of the whole, might be transferred in full to the landlords—these objects of their fierce jealousy—who yet would not be injured by the commutation, but would only become ostensibly, what they are really, the sole tributaries of the commonwealth.

9. We have before said, that, had no land yielded more, in return for the labour bestowed on it, than enough to feed the agricultural workmen and then

secondaries, the whole species behaved to be engrossed with the cares of providing for a subsistence. There could have been no leisure for higher and more dignified occupations. It is interesting, thus to connect the fertility of the soil with a disposable population, and with all which that population renders for the pleasures of human life, and the embellishment of human society. It is the overplus produce of land, after that the agricultural labourers and their secondaries have been fed—it is out of this, in fact, that law, and protection, and philosophy, and the ministry of religion, and art, and all that goes to decorate and to dignify human life, are upholden. It is because this overplus is possessed in quantities large enough, not only for the essential maintenance of its owners, but for enabling them, by the maintenance of others, to purchase a thousand gratifications both for the mind and the person—it is because of this, that the luxuries, whether of a more sensual or refined character, so abound in society. We feel quite assured, that a system which would fitter down this overplus into indefinitely minute portions, must tend to vulgarise a community, by absorbing, in the mere subsistence of an ever-increasing multitude of owners, what is now divided in subsistence for those who yield, in return for it, a thousand elegancies and enjoyments, that would have been otherwise unknown. It is no adequate reply to this, that these enjoyments and elegancies are monopolized by a few ; for, by the controlling

power of the state, the fund, out of which they are purchased, can be drawn upon indefinitely, not for the support of political interests alone, but for the support of Christian education and a national literature, and other benefits, of a high order, that are diffused among the many. Such a system of landed property, is not only the best fitted to enrich and enable a government for the support of liberal institutions and the effective patronage of genius; but the system is, in itself, a guarantee for the maintenance of enough of leisure, among a class sufficiently numerous to form an extensive reading public, and call forth the exhaustless varieties of an authorship, that is ever keeping the mind of society in vigorous play, and adorning it with the graces of taste and cultivation. So that, altogether, with the size and integrity of our landed estates, would we associate a greater amount of mental power and cultivation—both the benefits and the beauties of a more intellectual and polished commonwealth.

10. When it is alleged, that, under the existing system, the luxuries wrought up by the disposable population, are monopolized by the few, the imagination is, that were the system broken down, by the abolition of the law of primogeniture, the same amount of luxury would be diffused throughout a vastly greater multitude. But the truth is, that, in virtue of the process which would ensue, the disposable population would constantly be lessening, and the luxuries they rendered would every

year be diminished in their amount. The tendency is to an ultimate state, where, instead of luxuries or elegancies being divided among many landed proprietors, these proprietors would be unable to afford any luxuries or elegancies at all. Even for their own comfort, it would have been as well that they had been labouring in the ranks of the disposable population—as labouring, each in sordidness and straitness, on some little acre, from which the subsistence of a family could hardly be extorted. The drudgery of an artisan, in the manufacture of luxuries, is not worse than the ignoble drudgery of an over-crowded agrarian population. Under the system in question, the manufacture of second necessities might be kept up in its original extent; but the manufacture of luxuries would be indefinitely diminished. There would thus be very few, if any, of the landed proprietors that could command any of the higher enjoyments of life. There would also be fewer or smaller capitalists in the land; and, instead of our present beautiful gradation, we should behold a general levelling of all conditions, and nearly the whole of human society reduced to one common state of penury and toil.

11. And it is not true, that, in virtue of elegance, and luxury, and leisure, being the inheritance of a few, there is not a blessing in the present system of things to the whole mass of society. Under the opposite system, there would be nearly one unbroken level, the whole of which behaved, in time,

to be as sunk and degraded, as is the state of our present labourers. Now, it is a level, rising into frequent eminencies, of greater or less height, and of radiance, more or less conspicuous. And what we affirm is, that, from this higher galaxy of rank and fortune, there are the droppings, as it were, of a bland and benignant influence on the general platform of humanity. There is one very palpable evidence of this in the moral effect of a residing gentility; and we might also allege the consequent economic good of such a distribution, seeing that the moral and the economic in society are so intimately blended. The truth is, that the very elevation of mind and manners, caught as if by infection from the higher, forms our best security against an extreme wretchedness in the lower orders. If the people were once inoculated with a higher taste for the comforts and decencies of life, the else difficult, or rather, unsolvable problem, of a secure and permanent sufficiency for all their wants, would receive its most effectual accomplishment. And we appeal to general observation, if the symptoms of such a taste are not greatly more frequent and conspicuous around the habitations of our rural aristocracy. And, independently of its virtue in raising and refining the general tone of the people, it is surely, reasoning on the capability of things, a vast accession to a community, when there is in it a quantity of mind disengaged for general speculation, and therefore, if under patriotic and enlightened direction, in a state for devising

the best institutions and the best economy of things for the well-being of a nation. Law, and education, and charity, and all the collective interests of a state, are more likely to be put on their best footing—not, we admit, where arbitrary and despotic power stands associated with great property, but where regulated freedom and respectable property are blended. We feel quite assured, of every land of law and liberty, that, with an order of men possessing large and independent affluence, there is better security for the general comfort and virtue of the whole, than when society presents an aspect of almost unalleviated plebeianism. And it is of the utmost importance to the argument, that the breaking down of this affluence would ultimately do nothing for the enlarged sufficiency of the lower orders. Whatever beneficent effects, then, can with justice be ascribed to the existence and secure establishment of such an affluence—these we have all to the bargain. They form so much clear gain to the commonwealth; and though, at first sight, the whole good of it may appear to be absorbed by the children of fortune, there is, beside this absorption by them, a reflection on the commonwealth at large—a secondary influence, that is felt throughout the extent of society, and which goes down to the very humblest of its members.

12. For the best construction of a social edifice, in every large country like ours, we would have a king upon the throne—not rising like a giant among

the pigmies, or as an unsupported may-pole in the midst of a level population; but borne up by a splendid aristocracy, and a gradation of ranks shelving downwards to the basement of society. We doubt if the other monarchy could stand; or if France, with its citizen king, amid a mighty and ever-increasing swarm of smaller and smaller agrarians, can maintain its present economy for a single generation. We think of our own political fabric, that it not only affords a vastly greater number of noble and graceful spectacles, in the minarets and the blazing pinnacles which crowd its elevation—but that, abstracting from the degradation which has been caused by its accursed law of pauperism, it would have had a more elevated basement in its well-conditioned peasantry, than any other country or kingdom of the civilized world. It is not for the sake of its ornaments and its chivalry alone—it is not for the sake of these chiefly, that we want the high rank and fortune of our aristocracy to be upholden. It is because we think there is a soul in chivalry, which, though nursed in the bosom of affluence, does not cloister there, but passes abroad from mind to mind, and lights up a certain glow of inspiration throughout the mass of a community. Let it only be a land of intelligence and freedom—and we think that, where there are nobles, the common people are not so ignoble; and that, while the property of the rich, though scattered, as by the law of France, into innumerable fragments, would not add by a single iota to the average

comfort of our plebeian families ; yet the presence of the rich infuses a spirit that, by dignifying their characters, enables them, through the medium of their own habits and exertions, to dignify their condition also. It is thus, we hold, that there are materials in Britain, for the composition, altogether, of a finer, and higher, and happier society, than there are in America ; and that, without one taint of the pusillanimous in the spirit of our people, there might be a deference to rank, and withal a truer greatness of soul and sentiment, than republicanism, with all its coarse and boastful independence, can ever realize. We would therefore, on the whole, leave the existing framework of our own community undisturbed ; and, instead of letting down the peerage of our realms to the external condition of our peasantry, we should rather go forth among the peasantry, and do all that lies within the compass of education, both to elevate their standard of comfort, and to pour such a moral lustre over them, as might equalize them, either to peers or to princes, in all the loftiest attributes of humanity.

13. We again recur to the absenteeism of Ireland, in support of our argument. The crying evil of that land, is not that the wealth of its proprietors is withdrawn from its shores. Even though detained and spent amongst them, yet, did the people continue as reckless, and of as degraded habits as now ; then, through intervention of the sure principle of population, we should only behold a

larger, but in every respect as wretched a community. The benefit of a residing gentry lies, not in the money which they spend, but in the moral and humanizing effect of their presence. The peasantry, under this influence, would soon cease to be so degraded; and through the medium, not of external aid, but of their own internal principles and tastes, would attain to a more secure and respectable sufficiency. The popular cry, and on sound economic grounds too, is for a residing gentry; yet, with marvellous dissonance thereto, there is another cry for the spoliation of the church, that would, in fact, annihilate the best supplement for a residing gentry, which Ireland at present enjoys; we mean a clergy bound, in a vast majority of instances, to dwell and to officiate among the people. There is also a well-founded cry against the absence of proprietors. But they are little aware, that the cry for a system of pauperism, is a cry for that which will rivet this calamity, and make it irrecoverable. We do not say, that a compulsory provision for indigence will banish its large landed proprietors from Ireland, but it will annihilate the order altogether. For the non-residence of the gentry, it will bring on what is far more hopeless—the non-existence of a gentry; when the population, the victims of the most insensate experiment, that, in opposition to all the lights both of observation and argument, was ever attempted by statesmen, will remain in as great destitution, and withal in greater helplessness than ever.

14. We know that there is a mighty force of sentiment and natural affection arrayed against the law of primogeniture. But here is the way in which we would appease these feelings, and make compensation for the violence done to them. We would make no inroad on the integrity of estates; or, for the sake of a second brother, take off a portion, to the extent of a thousand a year, from that domain of ten thousand a year, which devolved by succession on the eldest son of the family. We should think it vastly better, if, by means of a liberal provision in all the branches of the public service, a place of a thousand a year lay open to the younger son, whether in the law, or in the church, or in colleges, or in the army, or in any other well-appointed establishment, kept up for the good and interest of the nation. We would still have the estate to support the younger branches; yet that, not by the violation of its integrity, but by a more severe taxation than our politicians of the present day have the courage to impose. Under the one system, the second brother would have his thousand a year, but give no return for it in any kind of service. Under the other system, he would also have his thousand a year, and the public have the benefit of a duty and a service from him to the bargain. Instead of a rustic idler, we should behold him a public functionary; and, under this arrangement, therefore, we should combine, with a provision for the younger branches of families, a greater efficiency and amount of public

service; a remedy against the destitution of younger children, and withal, a better served nation. The one system only proposes a single object—a provision for younger children; and this object, in the course of that indefinite comminution which must take place upon the territory, would at length be completely unattainable after a lapse of generations. The other system proposes a double object—a provision for younger children, along with a fully-equipped and full-paid agency in all the departments of national usefulness. And this object could be permanently upholden. The integrity of estates is not necessarily violated by a large taxation on the owners of them. Through the organ of government, each estate may be looked upon as loaded with jointures for the sake of the younger members of families; who, at the same time, instead of simple receivers, have to labour, in some vocation or other, for the benefit of the community. And believing as we do, that the real incidence of the taxes is upon land, we would enlist all the forces of natural sentiment and affection on the side of a larger revenue to government, and a larger allowance to public functionaries of all orders. We would infinitely prefer, that these feelings, generous and natural as they are, took a direction towards the increase of taxes, than, towards the abolition of the law of primogeniture. But it were well, in the present delusion, if these taxes were laid directly and ostensibly upon land. The whole work of retrenchment, that is now the favourite cry of pa-

trifles, both in and out of parliament, proceeds, we think, on a short-sighted view, or rather, a total misunderstanding of the real interests involved in the question. A large taxation is just a right corollary to the law of primogeniture. And the nibbling economy of those who would cut and curtail in all directions, is most perversely at variance with the consistent and comprehensive policy of every country where that law is in operation.

15. It will not for a moment be imagined, that, while we would apportion a much larger amount of the nation's wealth to the objects of public service, we contend for any hereditary or family right to that portion, on the part of the younger brothers of our aristocracy. It should lie open to the competition of all the worth and talent which may exist in any quarter of society. In the exercise of a virtuous patronage, it should always be disposed of to those who can give the largest return for it, in the value of their services. It is because of the greater ascendancy which the public mind has over the counsels and the doings of government, than at any former periods, that we feel both the safety and the advantage of a more largely-provided and better-paid agency in all the departments of the state, and of far more generous allowances to public and professional men. Now that the public mind has become more influential, we should like that the part it took were to direct the machinery of our national institutes, rather than to impair or to destroy it. This machinery the public will not

grudge to see extended, after that, under a reformed system of finance, it shall have become patent to general observation—that, with the law of primogeniture, the whole expense of supporting it is really drawn from the eldest sons of our landed families. And we contend for no more, in behalf of the younger sons, than that they should be admitted on equal terms to the competitions of this then larger and wealthier preferment, along with men of the requisite intelligence and accomplishment from all other classes of the community.*

16. It may be asked, if there is such a benefit in the size of estates, how far ought that principle to be carried; and would it really be desirable, that the territory of our island were shared among a few large proprietors, each having a domain equal to a principedom, and so with the entire annihilation of such a gentry as compose the actual landed aristocracy of Britain? We admit, though the subject be, from its nature, not very definable, that there is an extreme in that direction too, against which, however, we have a sufficient practical security in the existing order of things. But with the law of equal division in families, there is no security against the rapid descent of the nation into the opposite extreme. The land would speedily be frittered into shreds; and, under the load of an

* It is thus that taxation accomplishes what ought to be the popular object, of placing within the reach of general society, a portion of that wealth which would otherwise be restricted to hereditary proprietors.

agrarian population, ever augmenting and accumulating, the best interests of the community would most certainly be overborne. Having these views, it is with us a theme of gratulation, that there should be a law of primogeniture ; but we would earnestly contend, that this law, and a liberal provision for all public functionaries, should go hand in hand. This is the way of reconciling the highest interests of the public with the rights of families ; and that without injury to any of those economic objects, against which all taxation, however imposed, has been so unfairly set in opposition. We rejoice, more particularly, to think, that a church may be upheld in all its endowments, without being, in any right sense of the word, an incubus upon the nation—while it serves to mitigate the hardship which has been imputed to the law of primogeniture. We are aware that this is not the precise and proper argument for a religious establishment ; yet, convinced, upon other grounds, of the vast utility of such an institution, we cannot but regard it as one beneficent consequence of the law in question, that it enlists on the side of a church the warmest affections of nature, the sympathies and feelings of domestic tenderness. We are aware of the reckless and unprincipled patronage to which this has given rise ; and that a provision for younger sons has been viewed as the great, if not the only good of a church, by many who hold the dispensation of its offices. It is this which has alienated from the establishment so large a portion of the

community ; and if the abuse of an institute were a sufficient argument for its destruction, perhaps the Church of England will be found to have sealed its own doom, and to have brought upon itself the sentence of its own overthrow. But we still hope the impetuous spirit of the times may be tempered with discrimination, and that it will be judged better to direct the machinery than to destroy it. An apparatus, in its own nature beneficial, may have been perverted to evil ; yet the way is not to demolish or cast it aside, but to regulate its movements.

CHAPTER XIII.

ON EMIGRATION.

1. THE felt necessity of emigration from a country is, in itself, a practical evidence that its resources are not illimitable. We may be assured, that if other remedies for the destitution of the people were at hand, they would have the preference over this. Could home-colonization, or the invention of new employments, or the increase of capital, or the openings of foreign trade, have furnished ready and withal indefinite resources for our population, we should never have witnessed to any great extent among them, a disposition to renounce the scenes of their infancy, with all the charms and associations of home, for the chances or the perils of distant and unknown lands. We have already endeavoured to prove how it is, that the commutation of taxes and tithes must make room for a larger population; though that room would soon be occupied to the full; and after a brief season of general prosperity among all the classes of society, there would ensue the same straitness and difficulty as before. Proving, that, in every direction, and on all sides, there are limits at home, which throw back, as it were, the tide of our increasing numbers on the general community,

and produce a feeling of pressure and discomfort there, against which, relief is sought by an efflux of population from a land that is too narrow for them. We have now only to estimate the strength and the efficacy of this expedient, after which we shall enter, though briefly at this time, on the question of public charity; the last of all the expedients, which, if tried and found wanting, would seem to land us in the conclusion—that, either there is a helpless and irremediable necessity for extreme and extensive want in human society, from which, by no practicable device, can society be protected; or that, if there be a specific against this overwhelming calamity, it must be different from any of the expedients which shall have yet passed under our review.

2. When the agriculture of a country arrives at its limit, there is a pressure that would not be felt, but for the tendency of the population to increase. But long before this limit is reached, is the pressure felt; because the tendency to an increase in the population, exceeds the rate of enlargement in the agriculture. The probability, then, is, that even emigration will not remove, will not eventually alleviate, the distresses of our land. The same cause which outstrips the enlargement within, may also outstrip the efflux abroad. Certain it is, that the colonies of Britain, notwithstanding their perpetual draft on the families of the mother country, (and many of them but too powerful absorbers for our excess of population, from the balefulness of

their climates,) have still left us in a condition of difficulty ; scarcely, if at all, lessened by the outlet which they afford every year to such a number of adventurers. But this may be made a matter of computation. The capability of increase in the population, may be estimated with tolerable accuracy ; and the extent of emigration requisite for lightening the pressure of our redundancy, may be estimated along with it ; and that, with an approximation to the truth, sufficiently near for the purposes of a practical argument.

3. Population, when permitted its full development, by an unbounded supply of the means of subsistence, can double itself in fifteen years ; and we proceed on a computation greatly more moderate than this, when we affirm, that for an emigration, sufficient to allow an unchecked multiplication of our species in the British islands, there behoved to be at least half a million of human beings transported annually from our shores. The expense of so mighty a transportation, and the magnitude of that immense flotilla, which would need to be upheld for the business of these annual shipments, are of themselves sufficiently startling ; and might well disabuse us of the idea, that any very effectual relief can be ministered, by this expedient, for the wants of our population. But we may properly add the ever-increasing difficulty of new settlements abroad, after that the most accessible and best portions of territory had been occupied. It is no great recommendation of a

Scheme, that the longer it is prosecuted, it is always becoming more impracticable; insomuch, that every successive year must witness another augmentation both to the cost and the labour of it. Neither can we admire, as a sound or lasting expedient, for keeping right the overflowing population of one country, a process that hastens onward every other country to the same consummation. We should greatly prefer an expedient that would equally apply to all countries; and that would not lose its efficacy, even though the globe should throughout be peopled up to its capabilities; and the millennial era had arrived, at which we beheld a general fulness and prosperity in all lands. But the near, the practical consideration is, that the relief afforded even now, by all the emigration which even the most sanguine of its advocates can count upon, is but an insignificant fraction of what a population, left to its own unchecked spontaneity, would need; and every future year, this relief would become more insignificant.

4. Now here is the evil of every partial, and, at the same time, ostensible relief, against the effects of a mischief that is brought on by the general recklessness of the population. It adds to that recklessness; and so may aggravate the pressure on the one hand, more than it alleviates that pressure upon the other. This we hold to be the precise operation of a public charity, instituted for the supplies of general indigence. The power of it is overrated, greatly overrated, beyond the pro-

duct of it ; and so it relaxes the economy and the providential habits of the people to such a degree, that it falls greatly short of supplying the poverty, which itself may be said to have created. It is thus too, that in a country, the system of whose interests and affairs is much complicated by the multiplication and variety of its resources, we should look for a more oppressive redundancy of people, than in a country of simpler economy ; in Britain, for example, where the people have commerce and colonies, and the demands of various and lucrative professions to count upon, than in Norway, where the necessary limit of population is not so obscured by complexity ; and which limit, therefore, in consequence of being more distinctly seen, is more decisively acted upon. It is thus that the growth and enlargement of towns, though powerful absorbents for the population bred in country parishes, has not relieved, has, we think, on the contrary, augmented the pressure that is felt in the country ; and it is thus also, that the rise of colonies, the demand from both the Indies for men from Britain, has excited, we do believe, a greater overflow of population, than it can possibly draw away from us. And we have just as little faith in the virtue of emigration. We dread, that any vacancies left behind it, would not only be filled, and that immediately ; but filled, in a greater degree of compression than before. It would form just another of those resources, which, by adding to the general delusion, might aggravate the gene-

nal distress. A very slight relaxation in the providential habits of the people—and more especially in the habit of providential marriages—would suffice for this. And though the spontaneous emigration of families should be left to itself, we do fear, that a public, a proclaimed, a national system of emigration, would but enhance the evil it was devised to remedy.

5. Whenever emigration prevails, it is the evidence of a country where the population presses on the means of subsistence, from which pressure it seeks to be relieved by successive discharges. We believe that a regular system of emigration would certainly bring on and perpetuate such a state; and surely far more desirable, than that a people should thus press on the limit of their own home resources, were it, that they kept comfortably and somewhat largely within the limit. The effect of emigration has been compared to that of a safety-valve. But a safety-valve in the boiler, implies a great force of distension within; and surely it were better for every land, that the distension were prevented, than that it were only relieved, and kept down to a certain maximum, which cannot be sustained, without a strongly felt violence and discomfort within the borders of the territory. The alternative may be stated within a short compass. It were better that the population should not be carried up to the extreme of what the country can bear, by the recklessness of the people; than that it should be kept down to that point by

emigration. We may be sure that every country is throughout in a suffering condition, which requires to be disgorged, from year to year, of its redundant families. There may be a few spirits, alive to the charms and the romance of adventure, to whom emigration would prove a lure rather than a terror. But, averagely speaking, there must be a great experience of distress and destitution, to account for the voluntary exile of thousands from the land of their forefathers. It must be no light evil from which they are making their escape, when, in the act of doing so, they forego all the recollections of their boyhood, the scene and the dwelling-place of their dearest intimacies. Now, in respect of the economic condition of a people, it may be said, with peculiar justness, that if one member suffer, all the members suffer along with it. The destitution which forces a certain number, though it should be a proportionally small one, from the land of their nativity ; is the symptom of a general destitution and distress through the country at large, or at least in the profession to which they belong. And rather, infinitely rather than a system of things, which encourages a population up to the necessity of emigrating, would we prefer, that, in virtue of smaller numbers, the population fell somewhat beneath the employment which remunerates, or the food that sustains them.

6. We believe it to be strictly demonstrable, that wherever a sure and systematic, and withal, a permanent and generally known provision is made

for the excess of labourers in a land ; this, of itself, must depress the condition and circumstances of the whole body. This it does through intervention of the principle of population ; by which it sustains, in perpetual being, the very overplus which it is its object to dispose of. For, mark the effect on general wages of the mere existence of such an overplus. We believe, that no where can the provision in question be so comfortable, as would be a situation of well-paid industry in any of the regular trades or employments. Ere the former, then, will be sought after, there must be an excessive, and so a disappointed or defeated competition for the latter ; a competition which, though proceeding from a very small surplus of labourers, must, by an infallible law, effect a very great reduction in the price of labour. It is easy to present a beautiful sketch of home-colonization, and tell, for example, of the thousands who, in this way, have found a harbour and an establishment in Holland. But the real question by which the policy of such an institution is determined, is, whether it has operated any sensible relief on the mass of society, or does not rather tend to bring down tens and hundreds of thousands to that minimum state, in which they are hardly detained at their own occupation ; and that, by but a hairbreadth of preference over the state of a pauper agriculturist. In like manner, the system of English charity has encouraged an overflow of population, who fill up the asylum provided for them

in their numerous poor-houses; but not without first inflicting a sore degradation on the price of labour, and, what is worse, continuing to overhang, as by a perpetual load, the labour-market; thus depressing, and that permanently, the comfort and sufficiency of the whole body of labourers. And the very same, we predict, would be the consequence of a regular and extensive plan of emigration. It would at all times encourage into being, a certain fractional excess of people, beyond the number who can be accommodated in decent sufficiency within the borders of their own land. And so the alternative would need to be entertained, whether they will prefer an exile abroad, or the pittance of a scanty remuneration for their industry at home. But it is an alternative not confined to them. There are not two rates of wages; one for the overplus, whom, indeed, it were impossible specifically and individually to single out; and another for the general mass of the operatives in society. All are brought down equally; and, as in the other instances, this attempt regularly and systematically to provide for a small aliquot part, ends in the infliction of a universal calamity. So utterly powerless, or rather, so positively mischievous, is every expedient for the amelioration of the people, that but adds, through the medium of their own improvidence, to the excess of their numbers. The high road to their collective comfort and independence, and there is no other, is their collective virtue, and intelligence, and worth.

Off from this, both they and the patriots, or philanthropists who care for them, will find themselves alike helpless and bewildered. They may institute a thousand devices—schemes of benignant promise—smiling charities of goodly pretension and gracious aspect. They will all terminate in nothing, or worse than nothing. They smile but to betray.

7. We feel quite assured then, that the country is in a distempered condition, which is in the state of a vessel constantly running over. Rather than this, it should be in a state somewhat short of fullness. That policy must be very questionable which provides an egress, but at the same time encourages an ingress, that will certainly equal, and even tends to overpass it. In other words, emigration is any thing rather than a specific for the wants of a country; and just because it stimulates population. The abstracting process will yield no relief, if the replacing process be more than proportionally excited thereby. And amid the general impotency of this and all the former expedients, for the permanent comfort and well-being of the population, we feel shut up as to our only specific, to the operation of that moral check which regulates and restrains the increase of our species.

8. Yet, though emigration, absolutely and of itself, can do no permanent good, but the contrary, there are, however, certain transition states in the history of a nation, and certain processes of domestic and economical reform, which, perhaps, it

may subserve as a temporary expedient. Certain it is, that no scheme of emigration holds out such an incentive to population, as does the scheme of public charity which obtains in England; and we have sometimes thought, that if the more innocent of the two schemes could, for a time, be rendered subsidiary to the abolition of the more hurtful one, it might be the fit subject of a great national experiment.* Emigration, though futile and ineffective of itself, may still, as subsidiary to other schemes, be worthy of all the attention of government. It is well to discriminate between those purposes to which it is utterly incompetent, and those to which it may at least act as an important auxiliary. When advocated on the former ground, it lies open to a precipitate rejection; while, if viewed on the latter ground, it may recommend itself even to our soundest economists, as a great and beneficent scheme of national policy. When considered separately, and as a mere expedient for taking off an excess of population, we deem it to be utterly insignificant and useless. But not so, when conjoined with other schemes of internal or domestic economy; and rightly adjusted, not to the impracticable object of clearing away the excess of our

* We are sensible that, by this allusion to pauperism, we anticipate the regular progress of our subjects, but we feel that it might be done without violence, seeing that the majority of our readers must be already enough occupied with the evils of the system. Furthermore, our remarks on pauperism, in the next chapter, will be but succinct and general, it being a topic on which we have sufficiently dilated in former publications.

people by yearly abstractions, but to the higher and more hopeful object of preventing that excess.

9. It is thus that it might be brought to bear, in England, on the reformation of their pauperism. There can be no doubt, that the provision held out by this system of charity, has slackened the operation of the preventive check all over the country. It has multiplied and precipitated marriages in every part of the land. It has superseded the prudence and economy of the people; and such is the relaxation of these habits, that a fearful burden, both of vice and wretchedness, now lies upon the commonwealth, with little prospect indeed of any alleviation. The legislator, as if hopeless of all remedy, seems afraid to look at it. The spreading and deepening still further of a great popular corruption, is the inevitable result of letting it alone; and yet the attempt to meddle with it, appears to carry along with it the tremendous hazard of a great popular violence.

10. We think that the pauperism of England, even in its mildest, and some contend, its original form, has done great mischief. To have vested with a legal claim of relief, even the impotent and the aged, must have had its effect in creating a more reckless and improvident peasantry, and so speeding unnaturally onward the rate of population. But the more recently admitted claim of the able-bodied to relief, has had a still more direct and obvious tendency the same way. It, in truth, acts as an immediate bounty upon marriage. It is

no restraint upon the parties in this step, that they are without wages. In many of the English counties, they have recourse upon the poor-rate, and obtain an allowance from it for each member of the household. In these circumstances, we are not to wonder at the immense number of juvenile marriages in England. The merest stuplings have been known to enter into this alliance. They even threaten the parish vestries, that, if not more liberal in their dispensations of relief, they will marry, and bring upon them the additional burden of their wives and families. In some instances, the vestries have felt themselves obliged to rent, and even to furnish houses, for the reception of the newly-married couple. Who can question the effects of such a system? The whole of English pauperism may be regarded as a system of artificial incentives to population. But that part of it, more especially, which consists in the maintenance of able-bodied labourers without employment, and which, therefore, acts as an encouragement to all the youth of both sexes in the land, supplies the most direct and powerful of these incentives.

11. For ourselves, we do not approve of the late partial attempts which have been made for the reformation of English pauperism, by separating the question of a legal relief for the able-bodied, from the question of a legal relief for the impotent poor; since we hold that there is a practicable method for gradually getting rid of the whole. In either way, however, emigration might be of powerful

avail as an auxiliary; and may, in particular, be adapted in a way peculiarly beneficial to the case of those able-bodied poor who make application to the vestry, either because they are without employment, or because they receive for it inadequate wages. It were well could the alternative of emigration be offered to all such applicants; in which case, the legislature might be less scrupulous in repealing, even *instanter*, the application of the poor's fund to the relief of able-bodied labourers. Or, if they choose to go more gradually to work, it were still an important enactment, that all new applicants from among the able-bodied, all who made application for the first time, should be thus dealt with—that is, should be refused parish relief, but should, at the same time, be met by the offer of certain facilities for emigration.

12. When a scheme of emigration is thus tacked, as it were, to a scheme for the reformation of pauperism, it changes altogether its character and tendency. It, by itself, would stimulate population even beyond the relief which it could effectuate. But, when thus conjoined, it might help to restore the preventive check to its proper force, and do a great deal more, by its salutary influence on the habits of our people at home, than by all its successive shipments of the redundant families abroad. Even the latter service, however, is important in this view, that by it are chiefly carried off the breeders of the future generation—the parents of incipient families, who at present make application

because of their increasing numbers—or the young men, who meditate, and even menace the parish vestries with an impending marriage, that they might make good a larger claim upon the poor's rate. Every cargo of these effectuates not only a certain present, but a great prospective relief to the land—a relief which can only be neutralized by a still further relaxation in the prudential habits of those who are left behind, even that relaxation for which the system of pauperism is so deeply responsible, but which every encroachment upon the system must at least serve to diminish, if not to do away.

13. It is, therefore, to its wholesome reaction on the prevalent and popular habit in regard to matrimony, that we should look for the chief benefit of any such compound arrangement as is now contemplated. Emigration, separately, would cause no such reaction; but emigration, coupled with the abolition of all right or claim to parish relief at home, would operate, and that instantly, as a check to those juvenile marriages which are now so frequent in England. A young couple often will marry, though altogether without means of their own, on the prospect of immediate accommodation, however scanty, being provided for them by the parish at home. But it is utterly a mistake to imagine, that there is aught half so alluring to their eyes, in the prospect of a fearful ocean and an unknown wilderness beyond it. Of the ten who would marry, in the certainty of its being followed

'up by a parish allowance, we feel confident that there are nine who would not do the same thing, with no other prospect than that of having to renounce for ever the land of their childhood. They would pause, and cast about, and wait the means of their own independent maintenance, ere they should throw themselves upon a necessity so revolting to nature. In other words, they would feel compelled to a postponement of the matrimonial alliance, or to that measure, which, after all, is the great, nay, the only step, by which to resolve the problem of relief for the miseries of an overpeopled land. The refusal of parochial aid to the able-bodied, might safely be coupled with the alternative offer of assistance for their emigration; for, in the vast majority of instances, the alternative would not be taken: and so the people, committed to their own expedients and their own capabilities, would simply be restored to that state in which we behold the workmen and the peasantry of every other country in Europe. The labour-market of England, freed from the disturbing force of its present artificial pauperism, would henceforth be left to the operation of natural principles; and, in a few years, not by the drainage without of emigration, but by a resurrection within of prudential habits, it would cease to be so oppressed and overlaid by the number of labourers. It is when thus adjusted to other and greater schemes of reform in our domestic economy, that the scheme of emigration becomes really hopeful. While viewed

barely as an expedient for taking off the redundant families of our land, we fear that it can only be looked upon with distrust; and that all those who are most enlightened in the philosophy of public and political affairs, can have no value for it. But it instantly acquires a character of worth and of importance, when adapted to the object of beneficial legislation upon so high an interest as the pauperism of England; and if it should serve to reconcile both parliament and the public to such enactments as would mitigate, if not do away, the evils of a system, that has proved so hurtful to the comfort and the moral habits of the population. However slight our estimate may be of the absolute relief which emigration can afford, yet, regarded as subsidiary to the amendment of English pauperism, we should be sorry if the scheme were to be altogether lost sight of; it being possessed of those capabilities, and susceptible of those bearings, which make it altogether worthy of being entertained as a great and comprehensive scheme of national policy.

14. For, *first*, however desuabie the enactment may be, which should abolish the application of the poor's fund to the able-bodied, yet there is an apparent harshness or inhumanity in the proceeding, fitted to revolt both a generous public and a generous parliament. Now, emigration is fitted to remove this moral barrier in the way of a most salutary reform. The men who are thus discarded from their wonted resource, are not thrown into a

state of absolute helplessness. They have emigration between them and entire want. There is something given, or rather, something offered, for that which is taken away. It is not by a deprivation, but by a compromise, that they are dealt with. There are many of our legislators who would never have consented to the deprivation, yet may, perhaps, agree to the compromise. And this scheme of emigration will have effected a high service, if it shall but speed onward a right and a wise legislation, in a matter that ranks among the very highest of our national questions, and than which there is none wherein the strength and prosperity of the kingdom are more vitally interested.

15. And, *secondly*, there is nothing which should very much startle us, in this scheme, on the score of its expense. We believe that the number who will emigrate is greatly overrated. We are not to form our estimate upon this subject, by the number of those who have enlisted themselves as the members of Emigration Societies. Many even of these, however zealous and active now in their applications to government, would feel the preponderant attraction of home, when the outfit, and the voyage, and the everlasting leave of their native land, all looked at them in good earnest. It is true, that necessity will force men to any sacrifice; and we can scarcely imagine a better test of such necessity, than this offer of emigration. It will be found, then, we predict, that a great many of those who are now most clamorous for this relief, will not avail them-

selves of it; and that the vast majority of those able-bodied in England, who, at this moment, are receiving parish allowances, would discover some other method of finding for themselves, rather than encounter the peril of an untied enterprise, and the pain of an eternal separation from the country which gave them birth. On these accounts, government might, with all safety, meet the expense of such a scheme; and it is an expense that every year would lessen. For the colonies abroad, in proportion as their richer and more accessible territory was occupied, will hold out continually weaker allurements to emigration; and the country at home, in proportion as it was lightened of its surplus families, (not by abstraction, however, but by non-production, as we have already explained,) will have stronger attractions, in the ameliorated state of the people, for detaining them within its own shores. It is thus that the number of applications, so great, perhaps, at the first, as to appear quite formidable, would perpetually decline; and it would be found, that all the expense incurred, if indeed subservient to the proposed amendment in the system of pauperism, were the cheap purchase of so mighty a reformation.

16. But, *thirdly*, the expense might not be defrayed by government at all. It might be advanced by government on the security of the land, and repaid, after a period of years, by the emigrants themselves. Or it might be paid by the parishes from which the families do emigrate; and turn

out, after all, a cheap substitute for the far heavier expense of supporting these families at home. Still, however, we hold the chief recommendation of the scheme to lie, not in any primary or absolute virtue which it possesses of itself, but in the important function which belongs to it, as the auxiliary of another scheme for ridding the country of its greatest moral and political nuisance. We think, that, if only adapted to this object, the government might refrain from all that awkward legislation, by which it is proposed to save the country from the recurrence of that excessive population under which it labours. There is no doubt, that, so long as pauperism holds out an artificial encouragement to marriage, the gap which any emigration, however large, may leave behind it, will speedily be filled, and followed up, by as great an overflow as before. But the way to correct this, is not to lay restraint on the erection of cottages—not to neutralize the artificial encouragement by an artificial prohibition—not to counteract the violent or unnatural legislation in one direction, by the opposing force of a legislation as violent and as unnatural in another direction. The way to get rid of this whole complication, is to abolish the one, and refrain from the other. By simply doing away the application of the poor's fund to the support of able-bodied labourers, you restore the preventive check to its own proper and original energy; after which, the case may fearlessly be confided to the workings of liberty and nature.

CHAPTER XIV.

ON A COMPULSORY PROVISION FOR THE INDIGENT.*

1. THE last topic which we propose to discuss, in this catalogue of expedients for the removal of want from the human family, and the secure establishment of a general prosperity and abundance in its place—is a legal and compulsory provision for the poor. It stands distinguished from all the former expedients, in one important particular. Its object is, not the creation, but the division, of wealth. Its proposal, unless in so far as it seeks

* In excuse for the very rapid survey of pauperism here, we beg to state, that elsewhere the subject has been treated by us at much greater length and detail. The following are the titles of the various publications —“ The Christian and Civic Economy of Large Towns,” —“ Speech before the General Assembly of the Church of Scotland, explanatory of the measures which have been successfully prosecuted in St. John’s Parish, Glasgow, for the extinction of its compulsory Pauperism,” —“ Evidence given (by us) before the Select Committee of the House of Commons in 1830, on the State of the Poor in Ireland,” —“ Influence of Bible Societies on the Temporal Necessities of the Poor.” But, perhaps, the most complete view of our principles and methods in regard to the management of the poor, and with the least expense of time or labour on the part of the reader, may be had in a pamphlet entitled, “ Statement in regard to the Pauperism of Glasgow, from the Experience of Eight Years.”

employment for the poor, is, not to create additional produce, but to share the existent produce of the land more equally. It opens up no new resources; neither does it stimulate nor impart greater fertility to the old ones. It proceeds, not in the way of production, but in the way of partition; and, without enlarging the country's stock, would part it differently from before. We have tried to demonstrate the futility of all the other schemes, when taken by themselves, for the economic amelioration of the species—on the ground that, without the moral check by which to restrain the numbers of mankind, the addition made to human subsistence would speedily be overtaken, or swallowed up in the tide of an advancing population. But, in the scheme now under review, we behold no addition made to the stock of subsistence; and it may well discharge us from the obligation of an instant faith in its efficacy, when we, moreover, think that, of all the expedients, it is the most fitted to destroy the moral check, and so to call forth an augmented population, without the benefit of any augmented produce, by which to meet the new demands itself had created.

2. It is evident, that every levy upon property for the support of the indigent, trenches on the means of its owners for the employment and maintenance of the disposable population. There is no new provision created under such an economy. A part of the old provision is simply transferred, or withdrawn, from the sustenance of one class to the

sustenance of another class. Every additional impost that is laid upon me in the shape of poor's rate, lessens my ability to support those industrious who are remunerated for their services by my expenditure. Supplies are provided for the destitute in one quarter of society, at the expense, not of my enjoyments alone, but of privations to those who minister these enjoyments in another quarter of society. And, accordingly, it has been well observed, that, for all the visible relief effected by a poor's tax, there is as much of real though unseen poverty created among those, who have not yet entered within the territory of pauperism, but stand, a countless and untold multitude, around the very margin of it. The distress is not swept off from the face of the community. It is only shifted to another, and generally a far more deserving class of sufferers—to a mass of respectable families on the verge of destitution, struggling against the hard necessity of descending amongst the throng of sturdy applicants for a legalized charity; and all the more hopeless of relief, that the springs of gratuitous benevolence have been well nigh dried up, by the heavy impositions which the artificial or compulsory system has laid on the upper classes of society. It is thus, that, by a sort of festering and spreading operation, the sphere of destitution is constantly widening in every parish, where the benevolence of love has been superseded by the benevolence of law. Generally speaking, every year, or at least every decade of years, the

pauperism, like a moral leprosy, makes a wider sweep among the families than before.

3. We are not to wonder at such an effect, when we advert to the mighty stimulus which this system of public charity gives to population. It releases the people from all care or concern about the consequences of their precipitate matrimony. This step is not delayed as in other countries, till the necessary outfit and preparation for a family establishment shall have been completed. All restraint is taken off, in the way of early marriages; and the people abandoned to improvidence, multiply without limit, and beyond the capacity of the parish to find them in profitable employment. And the principle, on which a small excess in the number of labourers works a great reduction in the price of labour, then comes into sure operation. It is the same principle with that on which the price of necessaries fluctuates more largely, with minuter variations in their supply, than the price of luxuries. A man can more easily give up a fraction of his wonted allowance in the latter than in the former. He can more easily slacken his demand for the one, upon any short-coming in the supply, and so prevent an inordinate rise of price. But he cannot so well slacken his demand for the other; and so, in virtue of the more intense competition, there will be a disproportional rise in the price of the more important, because essential commodities. The price of bread will rise greatly more than a tenth, perhaps a third, though the crops

should be deficient only by a tenth. And thus it is, though in a reverse way, that the price of labour falls greatly beyond any increase which may have taken place in the number of labourers. The demand for employment, when like to be deficient, is just as intense as is the demand for necessaries, when these are like to be deficient. Employment, in fact, is the great vehicle through which the people arrive at the necessaries of life ; and when, by the superabundant supply of labour, there is a relative deficiency of employment, its wages will oscillate as largely in consequence, as does the price of the first necessaries of existence. A very slight overplus of workmen, will create a very sensible and general reduction in the price paid for their work ; and thus, by the connexion which obtains between a system of pauperism, and an increase, even though it should be small, in the numbers of the people, is pauperism responsible for a very sore depression in the condition and circumstances of the whole body.*

4. There is no such effect to be apprehended from the ministrations of spontaneous and individual benevolence ; injudicious, though it occasion-

* And as a small increase in the numbers of the people might operate a large depression in their circumstances, so might a small reduction in their numbers operate a large relief. An improvement in their moral and prudential habits, would very speedily effect an improvement in their economic condition, when, with not much fewer people than before, we should behold this change in the distribution of them—a larger secondary, and a smaller disposable class of labourers.

ally be, in its objects and its doings. There is no such system or certainty in its operations, as would lead to the same general dependence that is now felt in England, on the allowances of a legal charity. Individual charity can withdraw itself at pleasure, and will naturally decline the protection and encouragement of the worthless. But worthlessness, and that too of the grossest description, can compel, in its own behalf, the dispensations of the legal charity, and cast upon it the burden of all its own extravagance and folly. We have no such consequence to fear, from the fortuitous and free gratuities of the philanthropist, as from the regulated ministrations of the parish vestry, which are conducted irrespective of character, and require no other qualification than the actual indigence of the applicant. In the concerns of private benevolence, there is a delicacy felt on the one side, and a discrimination exercised upon the other; which, confined withal to incidental cases, form effectual guarantees against any general relaxation of moral or providential habits, as the fruit of its liberalities. But the benevolence of law holds out a wholesale bounty and temptation to improvidence. It has changed the timid supplications of want, into so many stout and resolute demands for justice. The cry of the distressed few for pity, has been strangely transformed by it, into the cry of a whole population for the redress and rectification of their grievances. All the tenderness of charity on the one hand, and all its delicacy on the other, have been

put to flight, by this metamorphosis of a matter of love, into a matter of angry litigation; and we now behold the formidable array of a multitude, fired with a sense of oppression against the upper classes of society, when, in fact, it is the oppression of their own numbers that has sunk them into a state of abject prostration, from which, while the present system continues, no wisdom and no benevolence of man can save them.

5. This system of legal charity is replete with all sorts of mischief. In the first place, by a direct tendency to multiply its objects, there is more of unprovided want in every region it lights upon, than there would have been without its ministrations. Beyond the margin of its operations, there is a far greater mass of unreached and unrelieved misery, than we should have had *in toto*, had no such system been instituted. In other words, public charity, so far from narrowing the territory of human wretchedness, has widened and extended it; and thus left a greater field than it at first entered on, for the exercise of that private charity, which it has at the same time weakened, both in its means and in its motives. It has deadened, as is patent to all observation, the charity of relatives, the charity of immediate neighbours, the charity of the affluent. It has therefore wrought a double mischief, creating a greater amount of indigence than before; and congealing the sources, whence, in a natural and undisturbed state of things, this indigence would have looked for its relief, and not

been disappointed. By every step it moves in advance, instead of approaching its primary and professed object, which was to curtail the sufferings of the poor, and if possible overtake them, it recedes to a greater and more hopeless distance away from it. In its economic design, which was to lessen or altogether remove the wants of the population, it has been foiled, and that most signally—so much, that, in very proportion to the largeness of its dispensations, do we behold a more straitened and distressed, and withal, a greatly more dissatisfied peasantry.

6. But if it have deviated from the true economic interest, it has more widely deviated from a still higher object of patriotism, even the moral interest of society. So intimately blended, indeed, are these two elements, that in every step of that degenerating process, which a compulsory provision for the poor never fails to originate, the economic and the moral deterioration go hand in hand. For how is it that indigence has been so multiplied under this system? Not alone by the imprudence which it has generated; as may be seen in the reckless marriages, and in the relaxed industry and economy of the people. But also in the vice which it has generated, the low and loathsome dissipation; the profligacy of both sexes; with all the mischief which proceeds from idleness, and through which the pauperism of England has become so deeply responsible for its immoralities and its crimes. And how is it, again, that charity has

waxed cold ? Because law has endeavoured, however unsuccessfully, to cut off the occasions and the calls which nature had provided for its exercise. Hence the abandonment of children by their parents, and the desertion of parents by their children back again. Hence the frequent spectacle, in every parish, of runaway husbands, and of nearest relatives alienated in affection, because released from the obligations of duty to each other. And not only have the ties of relationship been broken, but the ties and sympathies of neighbourhood. The charity of law has superseded the charities both of home and neighbourhood. By absolving the people from all mutual care, it has well nigh stifled within them all the feelings of mutual kindness. “Am I my brother’s keeper?” is the question practically put by those whom nature designed to be the guardians and the helps of each other ; it being a question prompted by the lying promises of the system under which they live, and which has undertaken, though it never can fulfil, the guardianship of them all. And it has not only weakened the cement which binds together the contiguous parts of the social edifice, but it has effected a menacing disruption or rent between the higher and the lower divisions of it. There is in England a gulf of separation between the rich and the poor, exemplified, we believe, in no other land, where the parties regard each other as natural enemies—the one challenging what they feel to be their rightful allowances ; the other re-

sisting what they fear to be interminable, and at length ruinous demands. The barriers of property have given way before the tide of an unrestrained population; and there is now a close and fierce conflict, between a sense of rightful possession on the one side, and the unappeased urgencies and wants of an ever-increasing multitude upon the other. The poor look to the rich as hard-hearted oppressors, detaining with stern gripe what nature and humanity pronounce to be theirs; the rich look to the poor as so many poachers on their domain. Compassion on the one side, and gratitude on the other, are alike unknown. The golden line of life, reaching from the apex of society to its basement, is dissevered; nor can we imagine, in consequence, a state of greater precariousness than that into which this system of public charity has brought us; or one that bodes more fearfully for the good order, or rather the stability of the commonwealth. It has, in fact, vitiated and distempered the whole breath of society in England. There now sits an unnatural scowl on the aspect of the population, a resolved sturdiness in their attitude and gait; and, whether we look to the profane recklessness of their habits, or to the deep and settled hatred that rankles in their hearts, we cannot but read, in these moral characteristics of this land, the omens of some great and impending overthrow.

7. And it adds to our hopelessness, that the growing disposition on the part of rulers, is not to

retrace this sore evil, but rather to rivet and extend it. In the face of all the English experience, Ireland, we fear, is about to welcome the footsteps of this most baleful pestilence; the worst visitor, in the midst of all her grievances and wrongs, that ever lighted on her shores. It is in those counties of England where public charity has done its uttermost, that distress lifts the most appalling outcry; and yet is this the very specific, which, with their eyes open, our statesmen are on the eve of administering, as their infallible remedy for the distress of Ireland. What has led to outrages of greatest atrocity in the one land, is to be transferred, and that with the design of quelling and allaying for ever, all outrage and discontent in the other land. The mightiest known stimulant of population, is now being brought to bear on the most over-peopled country in Europe. And to organize a nation yet in the wildness of its infancy, that system is to be introduced, which is evidently breaking up the frame-work of a society, where law, and civilization, and order, have had their abode for centuries. It is often by impulse, and not by reason, that public sentiment is drifted along; causing a tide in the affairs of men, which no wisdom, no experience can stem. There seems, at times, a blind and headlong necessity even in the moral world, which can no more be withstood than the currents of the ocean; transitions in the history of nations, during which, man, as if struck by impotency, stands in passive and trembling abey-

ance, till the hurricane have blown over him ; till the sweeping anarchy, resistless as the onset of the elements, have spent its violence, and the high ordinations of Providence are fulfilled.

8. In the treatment of this controversy, romance and reality have been confounded together ; and the lessons of sober experience have been as little regarded, as if they were the reveries of unsubstantial imagination. What truth, for example, of firmer and homelier cast, or more remote from the visions of fairy land, than the strength of the parental and relative affections ? Or what admits of being more familiarly verified, than the promptitude of that mutual sympathy and aid, which obtain in every neighbourhood, when some signal visitation of distress has come upon any of the families ? It is by stifling the exercise of these principles, and laying arrest on these undoubted and universal processes, that a public and legalized provision for the poor has wrought one of its deadliest inflictions on the cause of humanity, by closing far kindlier and more effectual sources of relief than itself has opened. Yet this plain statement, capable though it most decisively be, both of arithmetical, and observational proof, is ridiculed and resisted, just as if it were a fond or high-coloured illusion, drawn from some fictitious region of Arcadia. Shall we refrain, it is asked, from a tax on the Irish absentees, that scope and opportunity might be left for some rare or romantic elevation of virtue among the Irish peasantry ? Now, the virtue for which we

contend, in our opposition to a poor's law, is neither rare nor romantic. We object not to any amount of taxation on the landed absentees of Ireland, if the produce of it shall be usefully, or even innocently applied. But, if applied in a legal and public way to the relief of indigence, we affirm, on the known laws of human nature, and on the grounds of a manifold experience, that—multiplying, with the one hand, the objects of destitution, and intercepting, with the other, those numerous, though unseen supplies, which circulate, at the bidding of nature, among the households, and throughout all the vicinities of the land—it will act, by a sort of two-edged malignity, in aggravating the individual distress, and, along with it, the moral and political distempers of Ireland.

9. Moreover, the influence of a poor's law on the state of general comfort in a land, is complicated with many other influences; and this has thickened still more the difficulties of the question. The common people of England stand palpably higher in the scale of enjoyment than those of Ireland; and this is enough for an impatient or immediate decision, with minds which have only room or comprehension for but one idea. It is forgotten, that, irrespective either of the want or presence of a poor's law, the people of England and Ireland admit as little of being compared together, and differ as widely in their circumstances, as the peasantry of Norway do from the straggling hordes of Kamschatka. The law, the commerce, the in-

dustry, the Protestantism, the advanced civilization of England, have elevated the habits and state of the general community there; and would have done so still higher, had it not been for the depressing and counteracting influence of their poor's laws. The misgovernment, the yet untutored rudeness, the want of humanizing intercourse between the higher and lower classes, the dark and degrading Popery, which obtain in Ireland—have kept down the tastes and comforts of the general community there; and these would have sunk still lower, had a poor's law been superadded to the other causes of a people's degradation. The way to escape from the bewildering influence of this complexity, is to look to England singly, and compare the different parts of it; or to Ireland singly, and compare the different parts of it. In the one country, a poor's rate is universal; and where do we find the most distressed and dissatisfied peasantry? Just in the southern counties, where the levies and the expenditure of public charity are the largest—proving, that the genuine effect of the system is to depress, and not to elevate. In the other country, the want of a poor's rate is universal; and where, again, do we find the least distress and the lightest burden of mendicity? Just in those northern counties, where a Protestant education, and Protestant habits, are to be found—proving, on the other hand, the omnipotence of moral causes, and that, after all, the true sources of a nation's well-being lie deeply seated in the mind and character of the population.

10. Could one divest himself of all philanthropy and patriotism, and place every human feeling in abeyance, save a mere philosophical interest in the question—he might hail the experiment of a poor's law in Ireland. But there were a cruelty in this; like that of the cold-blooded physiologist, who, in his experiments on animated nature, could inflict every species of torture for the verification of a doctrine. We believe the attempt, whenever it is made, will be a most instructive one—but at the fearful expense of greatly augmented distress, and, at length, of entire and uncontrollable anarchy to the land. With the consequent insecurity and fall of property, one of the greatest holds of social order will be broken; and in the scramble which must ensue, we can perceive no other result, than the confusion, and the conflicts, and withal, the growing penury and straitness, which attach to a state of unlimited agrarianism. There will be a rapid equalization of fortunes—terminating, if not anticipated by some great political explosion, in the equality of a common and overwhelming wretchedness. Had England, in this goodly endeavour to assimilate Ireland to herself, but laboured to impart of her real and substantial blessings, and given to her sister island the light, and the liberty, and the industrious habits, of her own population—this had been some atonement for the misrule of centuries. But, instead of this, she presents her with the virus of that moral gangrene wherewith herself is infected; she deposits the seeds of that disease under

Which she is now ebbing onward to dissolution; and, in the dotage of her own expiring weakness, holds out, to the willing acceptance of a deceived people, that which, under the semblance of a benefit and a boon, is laden with the misery of future generations.*

11. But to return from this digression. So long as a compulsory provision for the poor is the established system of any country, the great, the only specific for its economic well-being is kept completely at abeyance. It is the sure and rapid advance of population which gives such powerless-

* Some have assimilated an endowment for the relief of indigence, to an endowment for the support of literary or Christian instruction. The two cases, so far from being at all like in principle, stand in direct and diametric opposition to each other. We desiderate the latter endowment, because of the languor of the intellectual or spiritual appetency, insomuch that men, left to themselves, seldom, or never, originate a movement towards learning. We deprecate the former endowment, because, in the strength of the physical appetency, we have the surest guarantee that men will do their uttermost for food, and a public charity, having this for its object, by lessening the industry and forethought that would have been otherwise put forth in the cause, both adds to the wants, and detracts from the real worth and virtue of the species. And, besides, there is no such strength of compassion for the sufferings of the moral or spiritual, that there is for those of physical destitution. An endowment for education may be necessary to supplement the one, while an endowment for charity may do the greatest moral and economic mischief, by superseding the other. Relatives and neighbours could bear to see a man ignorant, or even vicious. They could not bear to see him starve.

ness, or leaves such a short-lived efficacy to every other expedient. No augmentation of resources from without, can keep head against the stimulated over-growth of this all-devouring energy from within. There may be perpetual accessions to the bulk, but none whatever to the comfort of society. A more unfortunate device could not have been imagined, by which to neutralize the good of all possible enlargements, from whatever quarter they may be afforded to us. No enriching process, whether by agriculture, or by home and foreign trade, or by the removal of existing burdens, will countervail that process, by which, under the system of a bounty for the multiplication of the species, one and all of them must be so speedily overtaken. The pressure may, for a time, be slackened; or a few short respites of felt ease and enlargement, may mark our successive advancements towards the state of a greater community than before. But the tide of population, and more especially when urged forward by pauperism, that arch-destroyer of all prudence and principle among the families, will keep us permanently sure of at least one unchanged and unchangeable element—and that is, as wretched a community as before. If, in virtue of a moral restraint, consequent on the growing taste and education of our people, their numbers could be kept sufficiently within the limit of their means; this, of itself, would be the unfailing guarantee of a general and wide-spread abundance, whether

With, or without, any external augmentation. But, with the utter recklessness engendered by a poor's law, all such hopes must be given to the wind. And, whatever reforms may take place, whether in the political or economical systems of our land, let all taxes, and tithes, and monopolies, and inequalities of right or privilege, be done away, with the continuance of this single law, the power and promise of all these expedients will utterly come to nought; and we shall have no other prospect before us, than one of helpless and ever-increasing deterioration.

12. But the full effects of such a system will be anticipated by its own violent overthrow. From its very nature it cannot last; containing, as it does, within itself, the sure seeds of dissolution. The radical error of a poor's law consists, in its assigning the same treatment to an indeterminate, which is proper only to a determinate virtue. The virtue of humanity ought never to have been legalized, but left to the spontaneous workings of man's own willing and compassionate nature. Justice, with its precise boundary and well-defined rights, is the fit subject for the enactments of the statute-book; but nothing can be more hurtful and heterogeneous, than thus to bring the terms, or the ministrations of benevolence, under the bidding of authority. This fatal mistake involves in it a great deal more than a mere scholastic incongruity, or but the commission of violence on an abstract principle. So nicely adapted is the me-

chanism of human society, to the axioms of the most deeply, if but soundly philosophical jurisprudence, that any law which contravenes these, will soon betray the flaw in its principle, by the palpable mischief which it works on the face of the commonwealth. The claims of justice are definite and precise, and withal, strictly accordant to the natural sense of morality ; so that the law which enforces these, while it compels the observance of certain intelligible limits and lines of demarcation, is acquiesced in by the general mind of society. But the law which would enforce charity can fix no limits, either to the ever-increasing wants of a poverty which itself hath created, or to the insatiable desires and demands of a population, whom itself hath corrupted and led astray. Under this system, all is lax, and precarious, and indefinite. The holders of property can see no end to the exactions of pauperism. And the nuisings of pauperism, with their constantly-increasing number and necessities, will overpass every limit in their aggressions upon property. The growing alarm on the one side, the growing distress upon the other, form the sure elements of an interminable warfare, which, if not prevented by timely reformation, must at length effervesce into an anarchy, that will alike sweep off all the good and evil of present institutions, and make room on the desolated void for the foundations of a new-modelled commonwealth.

13. We should most gladly abjure this whole

argument, could we think that the charity of law at all lessened the amount of human suffering, or that distress was not far more effectually, as well as kindly met by the charity of spontaneous nature. Could the ministrations of relief have been provided for by law and justice, then compassion may have been dispensed with as a superfluous part of the human constitution; whereas the very insertion of such a feeling or tendency within us, is proof in itself, of a something separate and additional for it to do; of a distinct province in human affairs, within which this fine sensibility of the heart met with its appropriate objects, and by its right acquittal of them, fulfilled the design which nature had in so endowing us. But by this unfortunate transmutation, this metamorphosis of a thing of love into a thing of law, this invasion by justice beyond its own proper domain on the field of humanity—nature has been traversed in her arrangements, and the office of one human faculty has been awkwardly and mischievously transferred to another. And the effect is just what might be always anticipated, when the laws and adaptations of divine wisdom are contravened by the short-sighted policy of man. Justice should have been left to do the things of justice; and humanity to do the things of humanity. But by the aggression of the one upon the other, this beautiful and beneficent order has been thwarted, and the consequence has been a very sore aggravation to the ills of society. By the interference of law with the

business of charity, a twofold mischief has been wrought. Human distress has been multiplied, and human compassion, its natural protector, has been weakened and paralyzed. And by the truly unfortunate meeting of these two consequences, there has been left, as the compound and aggravated result of both, a tenfold burden of *unrelieved* suffering upon the community. We say not, that the charity of compassion would have overtaken all the distress. But we say, that the charity of compulsion has fallen many times short of it, beside the bitterness and the poison which it infuses into the *morale* of society; lighting up a thousand jealousies and heart-burnings between the poor and the rich; and converting an interchange of good-will on the one side, and gratitude on the other, into a conflict of fierce and rancorous antipathies between these two great parties in the commonwealth.

14. It forms no exception to our principle, but is rather its legitimate consequence, that, while we deprecate a legal and compulsory provision for indigence, there is a certain species of public charity that we advocate to the uttermost. There are certain distresses incidental to humanity, the afflictions of necessity and nature, which cannot be too openly or too liberally provided for. There is all the difference that can be imagined, in point both of principle and effect, between an institution for the relief of want, and an institution for the relief of disease. The one multiplies its objects,

Not so the other. The one enlists the human will on its side. The other will ever remain the object of painful reluctance and revolt to all the feelings of our sentient nature. Open a door of admission for the indigent, and we shall behold a crowd of applicants increasing every year, because lured thitherward by the inviting path of indolence or dissipation. Open a door for the admission of the diseased, and we shall only have a definite number of applicants. Men will become voluntarily poor, but they will not become voluntarily blind or deaf, or maimed or lunatic. It is thus, that while an asylum for want creates more objects than it can satisfy; an asylum for disease creates none, but may meet all and satisfy all. Public charity has been profuse where it ought not, and it has also been niggardly where it ought not. It is a disgrace to our philanthropic age, if infirmaries, or dispensaries, or asylums, whether for the cure of mental and bodily disease, or for the keeping of that which is incurable, are left to languish from want of support, or compelled to stop short, ere the necessity for which they were instituted has been fully and finally overtaken.

CHAPTER XV.

ON THE CHRISTIAN EDUCATION OF THE PEOPLE.

1. WE are now drawing towards that great conclusion, for the sake of which we have described the very lengthened course of our by-gone argument. We have laboured to demonstrate the futility of every expedient, which a mere political economy can suggest for the permanent well-being of a community. At best, they but tend to enlarge the absolute wealth of a country, without enlarging the relative comfort of the people who live in it. They may conduct to a larger, but not, on that account, to a happier society. They may tell on the condition of families, during those brief and evanescent seasons, when the population is somewhat in rear of the wealth; but, on the moment that this distance is overtaken, there will be the same straitness and discomfort as before. In new countries, there might be a career of sensible advancement for centuries to come. But in old countries, if we count only on external resources, or the increase of means for the support of a population, leaving their numbers to proceed as they may, there is positively nothing which can save us from the habitual state of felt insufficiency and narrowness. There may be gleams of prosperity

*during the fluctuations, or the few short and successive stretches of enlargement which are yet in reserve for us. But all round, and in every possible direction, there is a besetting limit, which the mighty tide of an advancing population tends to overpass, and which, being impassable, throws the tide back again upon general society; charged, as it were, with a distress and a disorder that are extensively felt throughout the old countries of the civilized world. The only question remains then, Is there no way by which the tide can be arrested, before it comes into contact and collision with the barrier that repels it? Or, can the redundancy be prevented by a moral and pacific influence, rather than checked by the evils of extreme poverty, or that destroying turbulence which so often results from the distress and destitution of an over-peopled land?

2. The high road, then, to a stable sufficiency and comfort among the people, is through the medium of their character; and this effectuated by other lessons altogether than those of political economy. We object not to the utmost possible illumination of the popular mind; nor do we share in the antipathies of those who would refuse science to the multitude. It is not, however, by the instructions of the economic, but by those of a higher school, that the best economic condition of society will at length be realized. It is possible for men to bear an essential part in the workings of a mechanism, of whose principles and whose theory they are al-

together unconscious—just as the planetary masses^r are unconscious of the magnificent regularity to which their own movements have given rise. The moving force, that is to advance the general multitude to a better and higher condition than they now occupy, will not be brought to bear upon them by the demonstrations, however just, of any theory; and, in fact, the right impulse, and the right habit, have often been exemplified, and by large classes of peasantry, before the theory of population was ever heard of. It is so in Norway; and, most assuredly, without any inoculation of principle from the school of Malthus. It was so in Scotland, long before the promulgation of his doctrines. In both countries, they realized, in practice, what, in system and philosophy, they did not understand. A moral and intelligent peasantry, imbued with a taste for the respectabilities of life, mixing prudence and foresight with every great practical step in the history of their doings, holding it discreditable to enter upon marriage without the likelihood of provision for a family—such a peasantry have more than once been exhibited in the annals of the world, and may be made to re-appear. If, by any means, the elements of such a character can again be put together, and made general in society, we should behold the exemplification of the Malthusian doctrine, with^r or without the comprehension of its principles. It is not, most assuredly, the study of these principles that will germinate the character; and it is from another

•quarter altogether, than the demonstrations of political economy, that we are to obtain the fulfilment of those blessings to society, which the science can only point out without being able to realize.

3. On no other subject does Christianity more evince its immense importance to the well-being of society. In the first place, it is quite palpable that they are its earnest and devoted teachers, who have the greatest power in drawing the multitude to their lessons, and establishing for themselves that most secure and deeply-seated of all popularity, which is grounded on the sacredness of their office, and on the subserviency of its faithful ministrations to the comfort, and the virtue, and the dearest interests of families. The mere disciples of a general literature or politics, little reflect on the prodigious force of that moral ascendancy which is possessed by a parish clergyman, who superadds, to the attraction of his pulpit, the charm and the efficacy of his household services; and who, by the countless attentions of an unwearied Christian benevolence, has ingratiated both his person and his cause with the hearts of those among whom he expatiates. His direct aim is neither to purchase a reputation for himself, nor even to advance the temporal comfort of his people. It is to prepare them for immortality; yet, in the single-hearted prosecution of this object, he becomes the all-powerful, though, perhaps, the unconscious instrument of those secondary, those subordinate blessings, which form the only ones that a mere worldly

philanthropist cares for. The truth is, that the lessons of the gospel which he teaches, are all on the side of reflection, and sobriety, and that loftiness of character which consists in the predominance of the moral over the animal nature of man. A disciple of the New Testament, whose views are sublimed by its doctrines and its hopes, has gotten a superiority over the passions ; a certain nobility of soul ; a reach of perspective to distant consequences, whether on this, or the other side of the grave ; an ascendancy of sentiment over sense ; and, withal, a refinement and elevation of taste, which, though caught at first from converse with spiritual and eternal things, still adheres to him, even when busied with the interests and concerns of the present life : and these, altogether, form the best guarantees against that impetuous appetency, which first leads to early marriages, and afterwards lands in squalid destitution, the teeming families that spring from them. And, besides, in that book there are so many pointed admonitions, that each should provide for himself, and for his own household ; such a preference for the single state, when the married endangers a man's Christianity, or his performance of its duties ; such great examples, as well as precepts of independence—especially by Paul, who says, that “ if a man will not work, neither should he eat,” and who himself laboured, with his own hands, for the supply of his own necessities, rather than be burdensome ; that, as the undoubted effect upon the whole, the honest and

frequent perusal of Scripture by a Christian people, does associate, in their minds, both the present and the prospective cares of a family with the solemn duties of religion. This is not a picture, but a reality, often exemplified in the abode of a cottage patriarch—where, along with his Christianity, we may witness a sufficiency, and a cast of elevation, not to be found in the houses of the irreligious and the unholy. The very library of old and favourite authors upon his shelves, is but in keeping with the general fulness of a tenement, usually better stocked and provided than that of any of his fellows. The Christianity of the man has engendered a wisdom, and a consistency, and a self-command, that led him to begin well in his entrance upon a family; and so to build up a respectable sufficiency, which, with a reckless and precipitate commencement, he could never have attained. An individual Christian is generally in better comfort and condition than other men. A whole parish of Christians would be a parish of well-conditioned families.

4. But here it is of importance to remark, that, for the production of a general economic effect, we have not to wait the production of a general Christianity. When expatiating on the connection between these two elements, we have often to encounter a certain shrewd incredulity, as if an expectation of a more elevated state for the majority hung on the fulfilment of a prior expectation, which is in itself Utopian—even that the majority shall be

converted. The imagination is, that, for the purpose of any great or sensible effect in this way, the religious character must be of co-extensive magnitude with the economic improvement; whereas there is no truth, of which the most faithful and experienced of our clergymen have a firmer, though it be a melancholy assurance, than the exceeding rarity of conversion—there being many streets in our cities, many parishes in our land, where, in the high sense and significancy of the term, the number of real Christians might not reach to one in fifty. And the question therefore is, How can we anticipate either a general economic, or a general moral effect, through the medium of a Christianity, which, in respect of its saving and spiritual influence, makes such little way among the families? But here it is not adverted to—and we admit it is indispensable to the force of our argument—that the secondary influence of Christianity goes a great way farther than its primary or direct influence. For every individual whom it converts, it may, by its reflex operation, civilize a hundred. We have the palpable exemplification of this in Sabbath-schools, where, in a few weeks from their commencement, we may perceive a decency, and a docility, and an improved habit of cleanliness and order, long before there is ground for the assurance, that even so much as one of the pupils has yet been Christianized. And what is true of children in a school, is alike true of grown-up people in a parish—where the regularities of Sabbath ob-

servation, and the humanizing influence of ministerial attentions, and the general recognition of what is right, and reputable, and seemly, have all been in force, perhaps a century ago, and been handed down, with increasing effect, from generation to generation. It is of the utmost argumentative value upon this subject, that one man of decided piety, in a little vicinage, will impress, if not his own piety, at least the respectability of his habits and appearance, on the greater number of its families. They can admire, and even imitate, the graces of his character; they can aspire after, and even realize, the decencies of his condition; without so much as comprehending, or far less sharing, the unseen principle which has germinated them all. It is thus that Christianity has elevated the general standard of morals; and so spread a beneficent influence, far and wide, among the many, beyond the limit of its own proper and peculiar influence upon the few. It is this which gives it the property of a purifying and preserving salt in every community of human beings; and that, not merely in respect of those virtues which enter into the moral character, but also in respect of those virtues which are essential to the economic well-being of a people. Ten righteous men among the thousands of Sodom would have saved that city from destruction; and a like proportion would, in our modern day, save the thousands of general society from that utter debasement of profligacy and wretchedness, into which, without the presence

of Christianity in the midst of them, they will inevitably fall.*

* We are aware of no country which presents a more interesting field for observation than Holland—because none, perhaps, so close upon the extreme limit of its natural resources, and, therefore, none so dependent on the moral habits of its population for their economic well-being. We have great value for a recent communication from that part of the world, which appeared in the Sunday-School Teacher's Magazine, and from which we present a few extracts.—

“ I have spent five months, since last September, in Holland, living, for the most part, in an inland town, whence I could extend my walks into the rural and fishing villages around me, seeing much of the outward manifestations of character among the people. But in Holland, such is the public provision for the instruction of the lower orders, that every child is within reach of a good day-school, of which few do not actually enjoy the advantage. These schools, moreover, though themselves rather of a general, than purely religious nature, are not meant to supersede, but to harmonize and co-operate with the catechetical instructions of the churches throughout the provinces. Thus, religious knowledge is widely diffused, though, in respect to it, much of course depends on the comparative purity of doctrine and discipline, as well as on the comparative degrees of vital godliness, which are found in the different communions and congregations to which the parents may belong. Not only so, but although the public day-schools have had far more attention paid to them of late years than at any former period, still education has, for a long time, been so common and so cheap, that almost all old persons are found able to read.

“ Thus, what you readers and their friends are striving to effect for their dear *mother-country*, our Dutch neighbours have already, through the good providence of God, actually accomplished for what they call their beloved *father-land*. Surely, then, it must be interesting to the former, to know what, if nothing

* 5. But we must here remark, that, for the purpose of a general economic improvement, to be

more, are the outward and obvious results of such a measure of success in their own favourite enterprise—an enterprise so intimately affecting the character and happiness of the millions that now people Great Britain and Ireland.”

“The first feature, in the lower ranks, which strikes a Briton, on coming amongst the Hollanders, is the almost universal decency of manners and dress which prevails amongst them, and that in spite of the extent of poverty which is found in these once flourishing, but now much-decayed provinces. Your readers will ask, why there should be so much poverty?—the reply to which is easily furnished out of history.”—“We must not therefore impute it to education, that there are many thousands of poor families and individuals in Holland, but ought rather to investigate what the effects of that peculiarity have been, on a people among whom this grievous extent of poverty has been the inevitable result of quite different circumstances.

“I am now referring to the external manners and appearance of the lower ranks in Holland. It is remarkable, that persons, travelling there about sixty years ago, represent the lower classes as very boorish in their manners, and as intemperate in the use of ardent spirits. But I found them invariably respectful, and willing to oblige me, while, as to intemperance, if it was to be found at all, it must have been very much hid from public notice, for I could not perceive either drunkards or brawlers in any quarter, either in town or country, during my whole residence among them. That they are universally sober, I dare not affirm, strong liquors, of various kinds, were very common, and very cheap, the damp nature of their climate, and the sea faring habits of many of the people, present a kind of apology for drinking, yet, in spite of all this, I must again affirm, that they are very far superior, at present, to the British in this respect.

“But to what are we to ascribe this change for the better, in the course of the last sixty years? Not certainly,” &c.—“May we not rather cite the following causes? First, The

brought about by the means of Christian education, a gradual abolition of the compulsory provi-

extension and improvement of daily schools, which began just about sixty years ago, and which have been continued, under all the changes of government, up to the present day. Secondly, To the awakening effects of public calamities, and the humbling influence of foreign domination on the members of the Presbyterian, and other Protestant churches, to which about two-thirds of the people are professedly attached. The Dutch, like the Israelites of old, were the children of many prayers, and the heirs of many privileges, but they, also, in the pride of their hearts, forgot God: he, therefore, in mercy, visited them with the rod of his chastisement. They were brought low, and were, many of them, led to cry unto the Lord in their distresses, and the Lord has had pity on them, and made his own work revive in the midst of them.

“ The outward decency, I might rather say, the respectability of the lower ranks, included a very remarkable observance of the Lord’s day, such, indeed, as I did not expect to find on any part of the continent of Europe,” &c.

“ I cannot conclude without remarking, that the absence of the poor’s laws seems to be one of the chief blessings of Holland. By having no compulsory assessments, the virtues of liberality and active benevolence are called out far more abundantly; and, by constant exercise, acquire a far higher degree of real practical vigour, than they could otherwise do amongst the rich; whilst the poor are grateful, frugal, and industrious. In short, all the lovely fruits of mutual Christian love and respect seem thus to be fostered, which might otherwise be injured or destroyed. I was particularly pleased with the mild and contented looks of many of the aged poor, and with the care and good housewifery shown in the apparel both of adults and children belonging to that class. I need not add, that in their food they are equally simple and contented.

“ Such, then, are the remarks I find myself compelled to make, with respect to perhaps the best educated poor in Europe,” &c.

ston for indigence, which now obtains in England, and hangs menacingly over Ireland, seems to us indispensable. We can anticipate no rise of wages, no elevation in the state and sufficiency of the working classes, from any efforts to instruct and Christianize them, however strenuous, if the pauperism and the education are to go on contemporaneously. We, in the first place, feel quite assured, from the moral influences of this public charity, that it operates as a dead weight on the ministrations of the clergymen, and stands most grievously in the way of their success. But, in the second place, however vigorous and effective his exertions may be, at the most, and while the present system of poor's laws continues, we shall have two distinct populations, each marked by opposite extremes of character. The clergyman, on the one hand, may reclaim hundreds to principle and sobriety, who shall form a wholesome and better class of peasantry. But the parish vestry, on the other, remains an attractive nucleus, around which there will gather and settle, in every little district of the land, a depraved and improvident class, whom the temptation of this legal charity has called into being, and who will bid inveterate defiance to all the moral energy which might be brought to bear upon them. The very presence of such a class, even though but a fraction of the community, will, with their reckless habits, depress and overbear the general condition of labourers. A very few supernumeraries, we have seen, will suffice for this effect,

So that whether the temptation to improvidence operates on all the people, or only on part of them, still that redundancy is generated which tells so adversely on the general rate of wages, and so on the comfort and circumstances of the population at large. Education will make head against mendicity. It will make head against poverty in any other form than that of being fixed and legalized, and invested with the power of challenging, as its right at the bar of justice, that relief which should have been left to the willing sympathies of nature. But shielded and encouraged as it is in the parishes of England, it will stand its ground, against every attempt to dislodge it from those innumerable fastnesses which it now occupies; and in spite of every counteractive, whether by the Christian or literary education of the people, will it remain an incubus on the prosperity and comfort of the lower orders.*

* The following is an extract from my evidence before a Committee of the House of Commons on the subject of Irish Poor's Laws.

“ It is a most important question for Ireland, whether you will submit for a time to its mendicity, or exchange that mendicity for a regular and compulsory pauperism. Now, on many accounts, I would prefer the former to the latter alternative, and one of my reasons is, that education will at length quell the one, but not the other. It may be difficult to furnish the Committee with a satisfactory analysis of this matter. I feel assured that so it is, however much I may fail in expounding how it is. One thing is abundantly obvious, that the act of becoming a mendicant is one of unmixed degradation, and the self-respect inspired by education stands directly and diame-

6. And we have further to remark, that as we look for no sensible improvement in the condition of the lower orders in England, while their present system of pauperism remains ; we as little look for any sensible or general improvement in their character, by the means of education, if that is merely to be the education of letters, and not the education of principle. It is not scholarship alone, but scholarship impregnated with religion, that tells on the great mass of society. We have no faith in the

trically opposed to it. It is not so with the act of becoming a pauper, a state sanctioned by law, and in entering upon which, the consciousness of right, and the resolute assertion of it, awaken feelings that serve to temper the humiliations of charity. I think that this admits of historical illustration. The mendicity of Scotland gave way in a few years to its education. The pauperism and education of England have for many years advanced contemporaneously. I do not believe that the most efficient system of education which can be possibly devised, will ever make head against the pauperism of England, at the very most, it would but give rise to two populations, distinguished from each other by opposite extremes of character. I should therefore be exceedingly sorry, if Irish mendicity were exchanged for English pauperism. I think that the floating mendicity of Ireland will fall, under the operation of those moral causes which might be brought to bear upon it, but if, in order to escape from this, you establish a law of pauperism, you will in fact establish so many parochial fixtures, or a nucleus in every parish, around which your worst population will gather, and from which you will find it impossible to dislodge them. I should exceedingly regret, if under the influence of an impatience to be delivered from this evil of mendicity, you should, in getting quit of that which is conquerable by education, precipitate yourselves into that which is unconquerable by education."

efficacy of mechanic institutes, or even of primary and elementary schools, for building up a virtuous and well-conditioned peasantry, so long as they stand dissevered from the lessons of Christian piety. There is a charm ascribed to the scholastic system of Scotland ; and the sanguine imagination is, that by importing its machinery into England and Ireland, it will work the same marvellous transformation there, on the character of their people, that was experienced amongst ourselves. But it is forgotten, that a warm and earnest Christianity, was the animating spirit of all our peculiar institutions, for generations after they were framed ; and that, wanting this, they can no more perform the function of moralizing the people, than skeletons can perform the functions, or put forth the faculties of living men. The scholastic is incorporated with the ecclesiastical system of Scotland ; and that, not for the purposes of intolerance and exclusion, but for the purpose of sanctifying education, and plying the boyhood of our land with the lessons of the Bible. The scholarship of mere letters, might, to a certain extent, have diffused intelligence amongst the people ; but, it is mainly to the presence and power of the religious ingredient, that the moral greatness of our peasantry is owing.

7. A common-place politician is mainly ignorant of the connection which obtains, between the religion of a people, and the various civil and economical blessings which follow in its train. This single lesson, if but prized and proceeded on as it

ought, were to him the greatest enlargement of political wisdom ; and numerous are the practical corollaries which flow from it. More especially, would it lead him to uphold an ecclesiastical establishment ; but on very different grounds from those on which, in the spirit either of high state toryism, or of high church intolerance, it is so often contended for. There is with a class of thinkers, whom we have now in our eye, the vague imagination of a certain security derived from the connection between church and state ; insomuch, that, if this connection were dissolved, they would apprehend the immediate downfall of all our social institutions. And we have no doubt, that, if any of the church establishments in our empire is to be exterminated, it will be in the spirit of a general undirected frenzy, that will not be satiated on any terms short of a wasteful and wide-spread overthrow. They will share in a common fate, because the objects of a common hostility. But this still leaves unexplained, the precise connection, in the way of cause and consequence, between the existence of a religious establishment, and the stability of the general order of things. It is not because, through the lordly dispensation of its patronage, the higher orders are conciliated ; or because, through the hereditary veneration of which it is the object, the lower orders are conciliated. These will be found but frail securities, on a day of wild and lawless innovation ; and, without the revival of a diffused Christianity in our land, that

day will speedily overtake us. It is thus that a religious establishment is of no value, but as an instrument of Christian good; and it is this, and this alone, which should recommend it, either to the politician or the patriot. It is simply, as the best machine for the extensive Christianization of the families of a land, that it is at all worthy of being upholden; and, it is obvious, that, to this effect, a reckless, unprincipled, and unholy patronage, makes it altogether useless, perhaps worse than useless. It is our conscientious belief, that an establishment is an indispensable safeguard against a desolating flood of irreligion, but only in as far as that establishment is virtuously patronized. In other words, without the demolition of our existing machinery, but through its means, and provided that right and efficient men be appointed to work it, we hold that the country may still be saved. And, humanly speaking, its Christian instructors will be its only saviours. These reformers of our national morality will be the only reformers that will do us good. This is the great specific for the people's well-being; and, however derided by the liberalism of our age, or undervalued in the estimation of a merely secular politics; still, it is with the Christianity of our towns and parishes that the country is to stand or fall.

8. Our ecclesiastics are too little versant, and have therefore too little respect for the importance of political economy. And our economists stand at fully as wide a distance from things ecclesias-

tical. Both seem alike unconscious of the strong intermediate link that is between them, seeing that the chief objects of the one can only be accomplished through the successful exertions of the other. It was for the economists to have discovered the connection between a virtuous peasantry, and, through the consequent effect on population and wages, the greater sufficiency of their means, and their higher status in the commonwealth. But, while it was for them to perceive and point out this connection; it is for the practical educationists alone, and, pre-eminently for the Christian educationists, to make it good. The one may demonstrate what the essential condition is, on which the economic well-being of the common people turns; but it is for the others, and for them only, to realize the condition. It is for them principally, or rather for them exclusively, to supply that element, wanting which, there is an utter impotency and failure, in all the doings and all the devisings of our politicians, either to bring about or to uphold a prosperous society. No enlargement in the means of subsistence can be of any possible avail, if so rapidly followed up as heretofore, and still more if exceeded by the irrepressible advances of the population. At this rate, a larger community would be but a larger mass of wretchedness, a wider field of heartless and sickening contemplation to every lover of the species. What he longs to rest and regale his eye upon, is the joyous spectacle, not of overcrowded, but, through

the medium of cheerful, because well-paid industry, of comfortable families, substantially fed, respectably attired, and as respectably lodged in their snug and decent habitations. There is room, and there are resources in the country, not for an indefinite, but for a certain, and that a very large, yea, for a constantly, though not a quickly, increasing number of such families. Beyond this number, we have no taste for mere multitude, for a swarm of human creatures, for a reckless and ragamuffin crew, overborne by that most grievous of all oppressions, the oppression of their own redundancy. If such be the general *morale* of the working classes, it is vain to look either for peace or plenty within our borders. The object will bid defiance to all agriculture and all commerce. At most, these can but stretch out the wealth of a country, but without any sensible enlargement, if there be a stretching out of the population proportionably thereto. Each successive expansion will, in this case, be but a temporary shift, a brief postponement of the evil day, the support or suspension, for a moment, by some frail tenicle, ere the nation is precipitated into a gulf of wretchedness or anarchy. It would seem to argue a growing sense of desperation among our public men, that their schemes of patriotism and philanthropy are so thickening of late upon us; while but a semblance of relief, or, at the best, a short-lived respite will be all the result of them. It is by the efficacy of moral means, working a moral transformation, and by that alone,

that our deliverance will be effected, and little do the mere advocates of retrenchment, and colonization, and public works, and poor-laws, and other merely political expedients for the amelioration of the people—little do they know how utterly powerless all these enterprises are, while the Christianity of the land is unprovided for, and its Christian institutions are left inoperative, from the want of zealous and energetic labourers to fill them.

9. And perhaps this indifference or incredulity, on the part of politicians and political economists, lies much deeper than we have yet ventured to say. It may be something still more hopeless than ignorance. We fear, that with many of them, it may be distaste and antipathy. There is a certain style of Christianity, a lifeless, inert, and meagre style of it, which is tolerated in general society. But when it comes to be Christianity in earnest, the Christianity that speaketh urgently and importunately to the consciences of men, the uncompromising Christianity, that enjoins the holiness of the New Testament in all its spirituality and extent, and asserts the doctrine of the New Testament in all its depth and all its peculiarity—such a Christianity has been very generally denounced as fanaticism; and its faithful evangelical expounders have very generally had a stigma affixed to them, and been outcasts from the patronage of the state. And yet this is the only Christianity that will either attract or moralize the population; and that, not because of its deceitful adaptation to vulgar prejudices,

but, because of its truly divine adaptation to the actual workings of the human mind, and the felt necessities of human nature. While this enmity to the truth as it is in Jesus operates in the hearts of our rulers, it is perhaps a vain expectation, that the civil and political importance of its being sounded forth from the pulpits of our land shall come to be recognised by them. On this subject, they may have been struck with judicial blindness; and ere Christianity shall manifest its power to regenerate our social condition, and overspread the land with prosperous and contented families; perhaps it will first vindicate itself on our ungodly nation, in the utter dissolution of an economy which disowns it, in the vengeance of some fearful overthrow.

10. But however blind our mere earthly politicians may be to the rationale of that process, by which man is regenerated into a new moral character, they clearly apprehend the connection, between the existence of such a character, and the economic well-being either of the country or of the individual who possesses it. Grant but the general ascendancy of principle—and, along with this, you will have a prudence, and a prospective caution, and a superiority to mere animal or constitutional impulses, which must necessarily ensure the habit of later marriages, and so, of smaller families. And then, of itself, by a law of political economy, which can no more be contravened than a law of nature, the state of the common people

will necessarily be raised. There are only two ways in which to augment the price of labour—either by a diminution of the supply, or by an increase of the effective demand for it. But the whole of our preceding argument goes to prove, that this demand for labour cannot be carried beyond a certain limit. There is a necessary limit to agricultural produce, or, in other words, to the maintenance of labour, without which there can be no effective demand for it. Consequent to this, or rather almost identical with this, there is a limit to that employment, for the produce of which, there might be obtained in return the subsistence of the labourers. There is a limit to the extension of that capital, the accumulation of which has been regarded by many as the grand specific for the indefinite employment and maintenance of the labouring classes. There is a limit to the extension of foreign trade, which has been imagined to afford a field for the profitable industry of our workmen, as unbounded as are the resources and magnitude of the globe. There is a limit to any brief or temporary enlargement, which might ensue on the commutation of taxes and tithes. We would not say that there is a limit to the enlargement, for we hold, that no enlargement whatever of the means of subsistence would accrue to the community, from the abolition of the law of primogeniture. So that we should hold it utterly hopeless to obtain a secure and permanent elevation in the state of the working classes, by a mere increase in one term

of the proportion; that is, in the effective demand for their labour. The proportion will remain as unfavourable to them as before, should there be a like contemporaneous increase in the other term of it—that is, in the supply of labour, or in the number of labourers. It is because the rate of advancing population may outstrip the rate of enlargement in any one of the resources now specified, or in all of them put together—that in every stage of the progress of society, there may be felt a continued pressure on the means of subsistence. But it is in the latter stages, it is in old countries, where all the barriers recede most slowly, because nearest to the place of their extreme and ultimate attainment, and where, at the same time, the power and tendency of increase on the part of the population are as great as ever—it is there where the pressure is felt most strongly; more in Britain than in America, for example; more in the Netherlands or in France than in Russia. It is this increase in the supply of labour, up to, and often beyond the increase in its demand; it is this rapid occupation, or rather overflow by the one of every enlargement that is made in the other; it is this which sustains, under every possible advancement in the resources of the land, the pressure of the population on the food, and makes the problem of their secure and permanent comfort so very baffling, and as yet, so very hopeless.

11. In the futility of every attempt permanently to relieve the wants, or to raise the comforts of

the people, by means of an increase on one term of the proportion—the effective demand for labour—we are shut up, as our only refuge, to a diminution of the other term—that is, the supply of labour. The only expedient which we have yet considered, and which proceeds by an operation on this second term, is that of emigration. We have tried to demonstrate, how impotent and ineffectual this expedient is; and how utterly unable we are, by all the successive drafts or transformations of families that we shall ever make, to prevent the fulness, even to a distension, of people in the land. We feel assured, that it is not by drawing off the redundancy of the population, after it is formed, that we can uphold a well-conditioned state of society—but by preventing the formation of that redundancy. In the whole round of expedients, we are persuaded, that this is the only one which, however obnoxious to sentimentalists, can avail for the solution of a problem otherwise irreducible. It has been the theme, sometimes of ridicule, and sometimes even of a virtuous, though, surely, a misplaced indignation; its distinctive excellence being, that it harmonizes the moral and economic interests of a community, and, indeed, can only take effect in proportion to the worth and wisdom of our people.

12. In the political economy of Dr. Smith, society is prosperous only when in progress. He confines his view only to one term—an increase in the demand for labour, or in the means of its sup-

port. He adverts not to the general prosperity that might ensue by a mere operation on the other term, or by a moderation in the supply of labour. He looks only to the augmentation of physical means; and perceives not, that, when these are stationary, it is still in the power of moral causes to uphold, what he terms a hearty state of the commonwealth. It was not otherwise to be expected; for his work, great and enlightened though it be, was long prior to the clear and convincing expositions of Malthus on the subject of population. And, accordingly, he makes the condition of the labourer to depend *entirely* on the state of society, in regard to the progress which it is making in wealth—that if this be on the increase, the condition is prosperous; if stationary, dull; if declining, miserable. According to him, the wages of labour must be higher in an advancing, than in an advanced state of society; insomuch that, after the wealth of a country has attained to its maximum, its industrious classes, comprising the large mass of the population, are worse off than when the country was only proceeding to the maximum. Now this were necessarily and universally true, if wages depended only on one element—that is, the extent of the effective demand for it. When the means for the maintenance of labour increase, and so, for the time being, are somewhat ahead of the population, the competition is in favour of the workmen—who receive larger offers, and a larger maintenance, in this state of relative plenty. But

should the population be encouraged by this state of things, the absolute plenty may remain, but the relative plenty is at an end ; so that, with a population again pressing on the means of subsistence, the competition is against the workmen—each glad to find employment, though with but an inferior and scanty remuneration. This process has been repeatedly exemplified in the history of states ; and it would seem to warrant the apprehension of some stern and mysterious necessity for the hopeless, the irrecoverable degradation of the lower orders—whose prosperity would thus appear to be in the inverse proportion of the country's abundance ; in-somuch, that to reach the extreme wealth of a land, might be to reach the extreme of depression and despondency for the great bulk of its inhabitants : as in China, the teeming productiveness of whose soil forms no guarantee against the constant want and wretchedness of its common people, or even the periodical starvation of millions.

13. Such instances speak strongly for the utter inefficacy, in the long run, of all those expedients which go but to enlarge the maintenance of labour, and so, the effective demand for it. That there have been many such successive enlargements, and that there are more still in reserve, even for the oldest and most civilized countries of the world, may be most readily admitted. Yet they form no security against either a continuous pressure all along, or a severe ultimate pressure, augmenting, perhaps, and becoming, more intense and intoler-

able, with every approach that is made to the extreme limit of the country's resources. There is not yet a state in the world, where the actual capabilities, for the maintenance of a population, do not fall short of the potential capabilities; and, with every new advance of the former upon the latter, there will, of course, be a slackening, as it were, of the pressure—a certain relief from that feeling of straitness, to which, in almost every stage of its progress, the population of a country is exposed. Yet this may be just a putting off of the evil day; and it does afford but a gloomy perspective to the lover of his species, when, as he looks forward on the economic advancement of society, he perceives an ultimate barrier, beyond which there can be no enlargement, and no possibility of mitigation. We confess that our anticipations are greatly more cheering; believing as we do, that, even in regard to earthly prospects, and earthly prosperity, a much brighter destination is in reserve for humanity. We admit, that there is a necessary and impassable limit to the extension of the physical resources of the globe; so that if the enlargement of these were our only confidence, as it seems the confidence of most of our economists, we should give up, in despair, a permanent amelioration in the state and circumstances of our general population. Our confidence, then, is not in the enlargement of those physical resources, from whence we are to count on an increase in the effective demand for labour—it is chiefly, I might almost say exclu-

sively, in the efficacy of a moral cause, from whence we are to look for moderation in the supply of it. When this is brought into operation, we shall find, that the wages of labour do not necessarily sink with the cessation of a country's advancement in wealth; that, even through the latest stages of this advancement, wages may indefinitely rise; and, after the stationary ultimatum shall have been reached in all the countries of the earth, still there will remain a way by which the industrious classes might be upheld in higher prosperity and comfort, than at any by-gone period of the world's history they had ever realized.

14. The two expedients then, of pauperism and education, stand very broadly and discernibly contrasted with each other, in the influence they respectively have on that proportion which we have now dwelt upon. By the one, the proportion is turned against, and by the other on the side of, the population. The one increases, the other lessens, the ratio of the numbers to the food. There is no withstanding of this operation; and there is no withstanding of its consequence. And the adoption of both expedients together were most grievous impolicy. The one would neutralize, or, rather, the one, like the rod of Aaron, would swallow up, would absorb the other, and be itself of paramount influence, at least on the economic state of the lower orders. The pauperism which enlisted all the sordid and sensual appetencies of our nature on the side of improvidence, would prevail in the

struggle, over all the moral counteractives of any system of education, however wise, and however energetic. The contest between a good and an evil principle, should no more be sanctioned or set agoing, by the reigning power of the state, than it is by the reigning power of the universe. In Scotland, they ordained education for the people; and in all those parishes, which stand sufficiently aloof from the contagious neighbourhood of England, do we behold a peasantry sustained in comparative comfort and virtuous independence. In England, they ordained a poor-law; and the cry of distress and discontent is just the louder, in proportion to the lavishness of its ministrations. In Ireland, they propose to ordain both education and a poor-law. This were the Manicheism of human government, and a frightful disorder will be the result of it. Did the evil barely neutralize the good, so as to make on the whole an innocent composition of the two ingredients, it might be viewed with less alarm. But it will be found not to be an innocent, but a mischievous composition. Burke had the sagacity shrewdly and instantly to perceive this. His was the wisdom of intuition, so that, without formal developement, or the aid of any logical process, he often, by a single glance, made the discovery of a great principle; and, by a single word, memorably and felicitously expressed it. That education is the cheap defence of nations, is one of the weightiest of those sentences, or oracular sayings, which have ever fallen from any of the

seers or sages of our land. And he characterized, with no less force and justness, the other expedient for the amelioration of his country, when he pronounced, of a legal charity for the relief of indigence, bearing on its forehead the smile and promise of a benevolence which is never realized—that it was downright fraud.

CHAPTER XVI.

CONCLUSION.

1. POLITICAL economy has had great influence on the politics of the world. The two are distinct from each other in themselves—nevertheless, in practice they are so intimately blended, that if the former were but well understood and consistently acted upon, the results in the latter department would be quite invaluable.

2. One palpable example of this, is the effect of an enlightened political economy, in doing away the commercial jealousy of nations. The objects of that jealousy were, in the general, altogether meaningless—the preservation of a monopoly or of a colonial dependence, or of some exclusive privilege, which, when wrested from the state, that had lavished in their defence an enormous amount both of blood and treasure, was found after all to have been of no real or intrinsic worth to the country that possessed them. It is thus that empires and states have entered fiercely into contest for interests which were altogether illusory. We do not happen to think that the system of free trade will lead to any sensible enlargement of wealth in almost any land; and that they who calculated upon this, did not advert to the existence, or at

least to the proximity of a natural limit, lying a very little way beyond the artificial one, and by which all commerce as well as all agriculture is bounded. Nevertheless, and however disappointed and defeated in their sanguine anticipations many may have been as to the economical effects of the system, its moral effects, in that it cancels a topic of ever-recurring controversy, and by which the peace and brotherhood of nations were kept in perpetual hazard, give an importance and a value to the policy of the free-trade system, which are beyond all computation.

3. Now, what is true of foreign, is alike true of home politics. An enlightened political economy would not only do away much of the jealousy which springs up among different nations; but would do away much of the jealousy and hostile feeling which are still so prevalent between the different orders of a state. For example, if the real incidence of the taxes be upon land, what a world of misconception and of malignant passion would be saved, were taxes laid ostensibly as well as virtually upon the landlords. Oh, if not prepared to act on a conclusion still so remote from all the ordinary notions upon the subject, what a practical reconciliation it would effect between the wealthier and the poorer classes, were taxes universally removed from the necessities of life, and universally laid on income or on unquestionable luxuries. We believe, that though the whole of our public revenue were raised by means of a territorial impost, it would ultimately

add nothing to the burden which now lies on the proprietors of the land; and that they, when fighting against such a commutation, are fighting in defence of an imaginary interest. We believe that the same observation applies to the abolition of the corn laws, and that, if both the commercial and the financial reforms were gradually, but at length completely and conclusively effected, the lords of the soil would find their wealth unimpaired, and their influence prodigiously raised by it. When once divested altogether of the character of monopolists, and, still more, when declaredly and obviously the only tax-payers in the kingdom; we can scarcely imagine the vast moral ascendancy which they would henceforth acquire in all the affairs and deliberations of the commonwealth. Such would be their substantial gain, and we honestly think without the deduction of one farthing from their revenues, though they should both quit the monopoly, and take upon themselves the whole burden of the taxes. And what a death-blow would be thus inflicted on the vocation of demagogues! What a sweetening influence it would have on British society, after the false medium was dissipated, through which the high and the low now look on each other as natural enemies! Such a political economy as this, had it preceded, would also have superseded all those tempestuous politics which are now in agitation. Parliamentary reform, left without any ulterior object, would have been felt as if uncalled for; or at least the rancour, the

exasperation, and bitterness, now connected with the prosecution of it, would have been completely done away.

4. The landed aristocracy have partly brought this upon themselves, by their blind resistance to all innovation, and by their tenacious adherence to what they imagine, but falsely imagine, to be their own indispensable interest. Had they paid all taxes, and left all trade unfettered, there would have no political sacrifice been required of them; and they would have remained in the undisturbed possession of their natural, their rightful inheritance, as lords of the commonwealth. But the democracy of England, fired by a sense of injury, have now made head against them; and may, perhaps, wrest from them, by force, that which ought to have been freely and willingly conceded in the spirit of an enlightened policy. We should rejoice in such a compromise between the two parties, as that both a full commutation of the taxes, and the full establishment of commercial liberty, unshackled by impositions or restraints of any sort, were at length effected, but effected gradually. What we fear in the present spirit of reform, is its impetuosity, and that it may not only, without the necessary delay, precipitate right changes, but, without the necessary discrimination, may hurry a new legislature into wrong changes. There lies a noble field of improvement before them, in rightly shifting the burden of taxes; in emancipating trade, and that without reserve or limitation, above all,

in providing, amply and liberally providing, both for the Christian and literary education of the people. But there is a waywardness of innovation which might carry ruin and overthrow in its train, and of this they will have to beware. They should meddle not with the national debt, save in an equitable adjustment of the taxes; else they will pass a sentence of confiscation on one set of proprietors to the enrichment of another set of proprietors, and these are exclusively the proprietors of the land. They should meddle not with the church, save to commute its tithes, and virtuously to control its patronage; else they will inflict an irreparable blow on the moral and literary wealth of the nation; and that to the relief and enlargement of no one class, but still of the landed proprietors. They should meddle not with the law of primogeniture; else they will institute a process, under which the state must wax feeble, and even our commercial greatness must disappear; our towns dwindling away, both in prosperity and in magnitude, and a numerous, but finally a wretched agrarian population rising up in their room. Lastly, they should meddle not, either with the monarchy or the peerage; for both a vigorous executive, and a certain *vis inertiae* of hereditary prejudice, are as indispensable to a right politics, as both the helm and ballast of a vessel are indispensable to a right navigation. In a word, instead of demolishing the framework of any of our existent machinery, we would have them but to guide and to animate its

movements. And it is precisely because we stand in dread, lest, through the stages of our future history, the sail should predominate over the ballast, so as to make the vessel of the state veer and vacillate with every wind of speculation, that we feel as if the national security were bound up, in our having more of an agrarian, and less of a mercantile parliament.

5. Still it is all important to remark, that the internal changes which we have ventured to point out, will no more open up an indefinite career of economic enlargement and prosperity, than free trade can. They will afford a certain stretch for a somewhat larger population, but they will do no more; when we shall at length find a natural limit far more hopeless and impracticable than the artificial one, there being no reserve beyond it. In these circumstances—that is, when the means cannot be made larger for the population, it becomes abundantly obvious, that nothing can save us from the miseries of a straitened condition, but a population small enough for the means. The highway to this is education. And this is a precious use of the enlargements which are still before us, and by which the families of the land are translated for a time from extreme misery, into a state of comparative ease. They then become fitter subjects for education, than when sunk in the distress and desperation of abject poverty. When viewed in the light of absolute or ultimate resources, we have no great value, either for the removal of prohibitions from

the corn trade, or for the removal of tithes and taxes from agriculture, or finally for emigration. But when these expedients are viewed in the relation of subseivency to the education of the people, (because they afford a temporary lightening of the pressure that is now upon their families ; and along with this, a spirit, and a leisure, and a means for their moral and literary culture,) in this light they may prove of incalculable service to the good of humanity. But still the position remains, that it is education, and that only, wherein the whole positive efficiency lies for a permanent amelioration in the state of the lower orders. Education is the specific ; and the other expedients are at best but the circumstances for a more fit and powerful ministration of it. But the whole effect of these expedients, when once put into operation, will speedily be exhausted. The favourable opportunities which they afford, last but for a season only. They are opportunities which cannot be recalled ; and if not improved for the purposes of a general education, they will leave the state of the population more irrecoverable than before.

6. We cannot bid adieu to our argument, without making the strenuous avowal, that all our wishes, and all our partialities, are on the side of the common people. We should rejoice in a larger secondary, and a smaller disposable population ; or, which is tantamount to this, in higher wages to the labourers, and lower rents to the landlords. But this cannot be effected, save by the people them-

selves—and that, not with violence on their part, or by any assertion, however successful, of a political equality with the other orders of the state. There is no other way of achieving for them a better economical condition, than by means of a more advantageous proportion between the food of the country and the number of its inhabitants; and no other way of securing this proportion, than by the growth of prudence and principle among themselves. It will be the aggregate effect of a higher taste, a higher intelligence, and, above all, a widespread Christianity, throughout the mass of the population; and thus, the most efficient ministers of that gospel which opens to them the door of heaven, will be also the most efficient ministers of their temporal comfort and prosperity upon earth. Next to the salvation of their souls, one of our fondest aspirations in behalf of the general peasantry is, that they shall be admitted to a larger share of this world's abundance than now falls to their lot. But we feel assured that there is no method by which this can be wrested from the hands of the wealthier classes. It can only be won from them by the insensible growth of their own virtue. The triumph will be a glorious, but, to be effectual and enduring, it must be a pacific one; achieved, not on the field of blood, or amid the uproar of a furious and discordant politics. It will be a sure, but a silent victory—the fruit of a moral warfare, whose weapons are not carnal, but spiritual, and which shall at length come to a pros-

perous termination, not in strife and anarchy and commotion, but in showers of grace from on high upon the prayers and labours of the good. Each several clergyman, who labours piously and conscientiously in the home-walk of his own parish, helps forward this great consummation, till, by means of a universal blessing, peace and plenty will become alike universal throughout the families of a regenerated world.

APPENDIX.

(A. page 41.)—*On the Rent of Land.*

IT is a signal error in a recent theory of rent, that the difference of quality in soils is the efficient cause of it. The difference between the produce returned for the same labour from a superior soil, and from the one last entered upon, is but the measure, and not the cause of rent. Had there been no gradation of soils, but had all been of the same uniform fertility with any given land which now affords rent, that land would have afforded rent still, and the same rent which it does at present. That land may yield rent, all which is necessary is, that, with the price obtained for its produce, the occupier can more than pay the wages of the labour and the profits of the capital bestowed upon it. It is the overplus which constitutes the rent of this land; and which would have been paid though there had been no land inferior to itself in existence. In affirming that it is the existence of

this inferior land which originates the rent, there is a total misapprehension of what may be termed the real dynamics of the subject.

The process is this :—On land of a given quality, and anterior to its being rented, the produce, or its price, is shared between the workmen who laboured it, and the capitalist by whom it is occupied. But there are two reasons why this state of things might not be stationary—the one connected with the taste and choice of the workmen; the other, with the taste and choice of the capitalist. The workmen may be willing, rather than forego the pleasures of matrimony, to part with some other of their personal enjoyments, by entering soon upon this alliance; even though it should be so soon as that, through the medium of an increased population, they shall have at length to work for less wages than they might have otherwise preserved. And the capitalists may be willing, rather than forego the pleasures of accumulation, to part with some of their personal enjoyments, by sparing what they might have spent, and vesting the produce of their parsimony in business—even though, through the medium of an increased capital, they shall have to trade for less profit than they might otherwise have been able to sustain. Thus, the increase of capital, and the increase of population, are the real impellent causes, why the wages and profit, which wont to absorb the whole produce of land of a given quality, do not now absorb it. The competition between the labourers, now in greater num-

ber, on the one hand, and the more numerous or greater capitalists, on the other, is such, that less than the whole produce is now shared between them, and the difference, wherever land is appropriated, goes to rent. Farmers, in the existing state of profit, and wages, and cultivation, are willing to pay this rent, for leave to settle on a land which formerly paid none; and should it so happen, that there exists inferior land beside that which is rented, and whose produce is just less than that of the other by the difference of the rent, farmers will be equally willing to settle on this inferior land, paying no rent at all. But, most assuredly, it was not the existence of the inferior, which originated a rent for the superior soil. It is not because farmers had descended to a worse land, that they are willing to pay rent for a better—but because they were willing to pay rent for the better, if they could have got it, they descended to the worse. The existence of the worse land, so far from originating a rent upon the better, prevented it from rising so rapidly as it would have done—because it afforded an outlet for the excess of population and capital; and thus slackened, for a time, their competition on the better land. The real cause of the rent, is this more strenuous competition of labourers and capitalists, now more numerous than before; and this cause, assigned by Dr. Smith, ought not to be superseded, as if it were a distinct and different cause, by that which, in fact, is but a consequence from itself. This in-

version of the truth, has led to vicious conclusions in political economy ; and, as is the effect of every false principle, it has mystified the science.

Rent is not a creation by the will of the landlords, but a creation by the collective will of the capitalists and labourers. Wherever there is property in land, it is the unavoidable result of the one class choosing to multiply, and the other choosing to accumulate, beyond the capacity of the higher soils to sustain them. It can only be done away with by the abolition of that property ; or, in other words, by turning the country into a large common, and dissociating all the activities of individual interest and hope from the business of cultivation. Labour would cease to attach itself to any given portion of the territory, if there were no fence of property by which the fruits of this labour might be guarded. This property has been termed monopoly, and all the odium which attaches to monopoly has been cast upon its holders. But the truth is, that the landlords are altogether innocent of the rent, which has flowed in upon them *ab extra*, not at their own bidding, but at the bidding of those who complain of its oppressiveness. The employer of labour would have had his workmen at a higher wage ; but another stepped forward and implored to be taken in at a lower wage, who, if refused, would have been in fact the more aggrieved sufferer, or at least the more helpless outcast of the two. The owner of the land would have let his farm at a lower rent ; but, in the im-

portunity of capitalists, higher rents were offered ; and he, by refusing these, would in fact have disappointed the most eager among the competitors. The landlord is passive under this operation. He is the subject, and not the agent in it. The primary and the moving forces lie with the labourers on the one hand, and with the capitalists on the other ; the former, through the medium of an increased population, having brought on a lower wage than otherwise, by a necessity as irreversible as any law of nature ; and the latter, through the medium of an increased capital, having by the same necessity brought on a lower profit than otherwise. The difference goes to rent. The complainers of it are themselves the makers of it. That the origination of rent should be rightly understood, is a thing of far mightier interest to the commonwealth, than the mere intellectual comprehension of a process. It is an incalculable loss to the working classes, when the real cause of their sufferings is misconceived. It bewilders the friends of humanity from the path of amelioration. And, besides, it provokes a thousand undeserved antipathies—being the fruitful cause of those many heart-burnings and jealousies by which society is so grievously distempered.

Rent is inseparable from property in land, and can only be abolished by all the fences and landmarks of property being swept away from our borders. The effect would be as instant as inevitable. The cultivation of the fields would be abandoned.

The population would be broken up into straggling bands,—each prowling in quest of a share in the remaining subsistence for themselves, and, in the mutual contests of rapacity, they would anticipate, by deaths of violence, those still crueller deaths that would ensue in the fearful destitution which awaited them. Yet many would be left whom the sword had spared, but whom famine would not spare—that overwhelming calamity under which a whole nation might ultimately disappear. But a few miserable survivors would dispute the spontaneous fruits of the earth with the beasts of the field, who now multiplied and overran that land which had been desolated of its people. And so by a series, every step of which was marked with increasing wretchedness, the transition would at length be made to a thinly scattered tribe of hunters, on what before had been a peopled territory of industrious and cultivated men. Thus, on the abolition of this single law, the fairest and most civilized region of the globe, which at present sustains its millions of families, out of a fertility that now waves over its cultivated, because its appropriated acres, would, on the simple tie of appropriation being broken, lapse in a very few years into a frightful solitude, or, if not bereft of humanity altogether, would at last become as desolate and dreary as a North American wilderness.

We may here advert to a distinction between the produce of agriculture, and that of manufactures; or, as some would say, of all other manu-

factures than the manufacture of food. We think that it will go far to explain the peculiarity of rent, and repel at once the imputations which have been grounded thereupon, both against land and against landlords.

To assimilate the two, and confound all distinction between them, it is said that land is as much a machine, and the preparation of food as much a manufacture, as are the machines and the preparations of any other commodity. Now, without objecting to this, as being a thing of mere nomenclature, there remains one important reality by which to distinguish them. Food is the first necessary; other commodities are but second necessities, or the luxuries of life. The increase of food will surely be followed up by an increase of population. The increase of luxuries, or even of second necessities, will not always, will not necessarily be so followed up. Should corn become permanently more abundant than before, it would in the first instance fall in price; and a fall in such a large and essential branch of family expenditure, would, by translating men so much sooner into circumstances of ease and plenty, multiply and hasten on the marriages of labourers. A fall in the price of mere luxuries, such as carpets or pictures or expensive wines, would have no such effect: and even a fall in the price of second necessities, as of stockings for example, would have scarcely any effect, excepting through the medium of agriculture, and by its influence on cultivation

in the way that we have already explained.* This is the reason why food cannot permanently remain as a drug in the market. It in fact creates a market for itself, which other manufactures do not. The peculiarity of the former commodity lies here, that though its supply may be overdone for a year or two, it cannot be overdone permanently, because there is a virtue in the commodity to extend, and that indefinitely, the demand for itself, so that, let the supply be kept up and augmented as it may, there will, in the necessity of things, spring up an equivalent demand by which to uphold its price in the market. The same thing cannot be said of other manufactured commodities—not even of second necessaries. The supply of shoes may be overdone year after year, greatly beyond the number of feet that wear them; because there is almost nothing in the mere production of these shoes to multiply the feet. But the supply of loaves cannot be so overdone year after year, because greatly beyond the number of mouths to eat them; for there is every thing in the production and increase of these loaves to multiply the mouths. It is true, that on that event the feet will be multiplied too; and with the increase of demand for food, there will also be an increase of demand for other things, or the products of other manufactures. But these manufactures have to wait the progress of agriculture, which itself has to wait for nothing but the development of its own energies

* Chap. I. Sect. 9.

and means. Agriculture has the command of both the terms which enter into the determination of price—immediately of the supply, and mediately, while rapidly, of the demand. Manufactures have but the command of one term; and they, by out-doing its progress, are exposed to the perpetual check of gluts, and bankruptcies, and losing speculations.

Now the rent of land is ascribed by Ricardo and others, to a blemish, whereof air and water are altogether free, and which, in consequence, yield no rent. In land there is a descending gradation in the quality of its soils; and the last of these which has been reclaimed, and which is the least fitted for the production of food, is alleged to be the cause of rent upon all the rest. But there is no such descending gradation in the quality of air; no difference, for example, in the strength of its atmospherical pressure at different places, if on the same level, so as to make it more powerful at one place than another for giving impulse to machinery. And hence, according to the advocates of the new theory, there is no air rent. But the great, and indeed only efficient principle of rent is here overlooked. It is very true, that if, within the limits of some square miles on the earth's surface, there were air of ten-fold property and power, then, all circumstances being equal, it would afford rent to the proprietors of such a small and favoured territory; and just because all the manufactured commodities that could be produced within limits so

narrow, did not satisfy the actual demand for them. But grant a certain definite number of these square miles, along with a right local disposition of them, and rent would cease altogether, whatever the descending gradation was in the qualities of the remaining atmosphere. The truth is, that the demand for such commodities as are wrought off through the instrumentality of steam engines, is limited by the actual numbers of mankind; and, by means of a very few square miles of the requisite atmospherical pressure, the world could be super-saturated with these commodities; so that all the air over and above this, whether of equal or inferior quality to the former, would lie a useless drug in the hands of those who should seek a rent for the use of it. Whereas, not only is the demand for those commodities which are produced by farms, or land machines, enlarged with every eventual increase in the numbers of mankind, but every addition to these commodities creates an addition to the numbers. The existence of a land, and the non-existence of an air rent, cannot, with propriety, be referred to any difference between the two elements, in respect of the gradation of their qualities. The difference is altogether resolvable into the nature or virtue of their respective products: the one of limited demand, being straitened within boundaries which itself cannot enlarge; the other widening the boundaries of its demand, and in the very proportion too of every new addition which is made to its own quantity. The simple cause of

a land rent is, that the best farms, or the best machines for the manufacture of food, work off an excess of this commodity, over and above that share which the capitalists and labourers employed about it choose to put up with for themselves. That they should so choose, is owing to the competition of other capitalists and other labourers, whom the agriculture itself may be said to have brought into existence, and all of whom would be willing to occupy the best machines for the same share, leaving the excess to go in shape of rent to their proprietors. And they of course would be equally willing to be put into occupation of the inferior machines at inferior rents, or of the worst machine that can be wrought with a profit at no rent at all. Rent is not owing to a blemish, but to a superiority in land machines over all others. They, in the first instance, can do what the others cannot; not only satisfy the actual demand of present customers for their produce, but, by every addition to this produce, can proportionally add to the number of their customers. And the vast majority of them can do what the other species of machines do not—they can work off a greater amount of their own appropriate commodity, than will remunerate the capital and labour bestowed upon them; and thus leave a surplus, by which the industry is upheld that works off a thousand blessings to society.

It would remove the blemish ascribed to the great instrument for the preparation of food by

our mercantile economists, (who have overlooked altogether the distinction, in point of virtue and effect, between the products of agriculture and those of manufactures,) could the business of the two, so unlike in their products, be likened in their processes. It is conceivable, that materials for the sustenance of human life could have been extracted, without let or limitation, by chemical manufacture, as by some treatment of decomposition and recombination, for example, on the air which we breathe; and that the food of a differently constituted species could have been manufactured this way, in such abundance, that it would more than suffice for the alimentering of as many creatures as the earth could accommodate with room to stand upon. This were an economy of things more suited to the taste of those who have cast reproach upon land, because of its limited capacities; and it were curious to trace the effects of it. The whole of the accessible atmosphere would come, in the course of population, to be engrossed; and then, if the air were appropriated, though with no gradation in its qualities, all that would be necessary for an air rent, were, that the food produced more than sustained the producers, and so afforded an excess that would go in the shape of revenue to its owners, and be expended by them on a disposable class of labourers. There would still be an air rent as at present. In this respect there would be no change; but there would be another and very important change, were the supposition realized of an indefinite capability

in human art for the support of an indefinite population. Should it be absolutely and altogether without limits, the effect, however undeniable, is so very extraordinary, that we are almost afraid to mention it. There is a certain point, beyond which, if human beings were multiplied, a serious inconvenience must be felt, from the mere crowding and compression of their excessive numbers. This is obvious enough, should it take place within the limits of any separate locality; but it would be as surely and severely felt, if, in virtue of a production of food *ad libitum*, it did take place over the whole surface of the globe. The human species would then become as sordid and miserable, as those maggots appear to be who swarm on some mass of hideous putrefaction. The herrings that accumulate and condense in the western bays of our island, are said to push the outskirts of their shoal upon the beach. And better surely that there should be such a limitation in the powers of the land, and such an utter impotency in human art to multiply beyond a certain point the means of subsistence, than that the great human shoal should be protruded at its extreme margin into the sea, and serve for food to the fishes there waiting to devour them. Rather than that this goodly earth of ours should be turned into a human ant-hill, is it better for man that he should have uncumbered fields—that he should have open and spacious solitudes to which he might make occasional escape from its more crowded receptacles, and might, on the am-

ple domain of nature, company with nature's elements, and inhale their freshness. It is no interest, and ought to be no care of his, that the terrestrial space on which he walks should be so overpeopled; or that, for the mere sake of numbers, human beings should multiply to suffocation. The number of his derived and dependent family, is the care of Him who sitteth on high—and most nobly hath He provided for it. He who hath the command of infinity, hath enriched its mighty tracts with innumerable worlds; and, without overburdening the one we occupy, He finds accommodation and space for the innumerable myriads of creation. Better far, than that, from the vomitories of human mechanism, there should go forth indefinite subsistence for indefinite multitudes—better far, that this should have its fixed and impassable limits; and that men, with the glorious arch of heaven above their heads, and with an ample platform beneath them, should walk forth in largeness and liberty, the privileged denizens of nature.

There is an optimism in the actual constitution of the land, as in every thing else that has proceeded from the hand of the Almighty. Had its fertility been limited to the maintenance of agrarian and secondary labourers, we should have had no disposable population; and neither science nor civilization would have arisen, to bless and to adorn the companionships of men. Had its fertility been unlimited, or could the powers of human art have extracted, without measure, the necessities of life

From any quarter of nature, the species would have lived in greater sordidness and misery still, on an earth laden by its wretched, because its overcrowded generations.

(B. page 74.)—*On Machinery.*

The impression against machinery has in it somewhat of the same subtle delusion which we have attempted to expose in the text. There is blended with it the imagination, that employment is creative of something else beside its own products. For the apprehension of many, and that not confined to the immediate sufferers, is, that with the introduction of every new method for abridging or superseding labour, there is the disappearance, not for a time only, but the permanent disappearance, of a resource to the labouring classes. The idea of their maintenance is strongly bound up with their occupation; and that, however remote, as in the case of buckle-makers, the product of their industry is from the materials of their food,—just as if, because buckles were to be no longer fabricated, the bread that went to sustain the fabricators, was to be no longer forthcoming; or as if the effect of such transitions was any other than merely to change the direction of industry, without impairing, in the least, those stores of human aliment,

by which as great a number of industrious is sure to be upheld in circumstances of as great sufficiency as ever.

We dispute not the evils, though but the temporary evils, that result from those transitions of employment which are caused by machinery. They form a strong claim on the aid and tenderness of the benevolent, when families, in large masses, are, for a period, thrown out of employment; and what were still more healthful, they form a strong call on the manufacturing class of labourers more particularly, to cultivate those providential habits, by which, in virtue of their accumulations, they might be enabled to weather the seasons of suspension and change, to which every people of mechanic and highly artificial industry are so peculiarly exposed. Nothing is more to be deprecated among a people so peculiarly circumstanced, than those institutions which discharge them from the care of themselves, and from all prospective regard to their own necessities—the consequence of which is, that they are perpetually kept on the brink of destitution; and so are landed, in total helplessness, on those occasions when, either by a depression in trade, or by an abandonment of old methods of industry, thousands are reduced to a state of temporary idleness.

The vindication of machinery from the charge of its adverse influence on the comforts of the poor, has been made to rest upon different grounds. It is not the true vindication, that the making of

the machines opens so great a source of employment, that the making and working of them together take up as many hands as did the making of the commodities without the machines; for, in this case, there would be no abridgment of labour, and no advantage to master-manufacturers in setting up the machinery. And it is not a sufficient vindication, that, when an article is cheapened by machinery, the demand for it is so much enlarged, as still, in spite of the abridgment in labour, to require as many, if not more, labourers for its preparation as before;* for this, though true of many, perhaps of most trades, is not true of all. The ultimate and substantial vindication is, that, however the demand may vary or be lessened for particular kinds of work, the fund, out of which the wages come, is left unimpaired. The maintenance abides with us, whether the counterpart employment abides with us or not; and we may be very sure, that this maintenance will continue to be discharged on labourers, if not for the very work, at least for some kind of work or other. The distress and inconvenience of the change are evils; but they are the only evils.

Machinery does not impair the fund out of which industry is supported—neither does it lessen the amount of industry, but only alters the distribution of it, and makes it more productive than before.

* This is the chief argument, very strikingly illustrated, of an admirable little treatise which has appeared lately, entitled, "The Working Man's Companion."

In manufactures, the same quantity of a given article is furnished with less labour—but I continue to employ and support the same labour as before, either by extending my use of that article, or by allotting the sum which its now greater cheapness has left in my hands to the purchase of some other accommodations. The war against machinery, is a war against human enjoyments.

In agriculture, it is also the effect of machinery to have the same work accomplished with fewer hands. And this, as before, does not diminish the population, but only changes the distribution of them. It may transfer so many from the agricultural, to the disposable class. If fewer farm-labourers are required than before, proportionally to this, a larger surplus-produce will go to the landlord than before; for, just as the consumpt or expense on the farm is lessened, rent will be increased. These two effects meet and correspond—the augmentation of rent, with the augmentation in the number of the third class of labourers. One of the most important effects of agricultural improvement is, that it enlarges the disposable population.

But machinery, both in agriculture and manufactures, is attended with another effect of a still more vital character, and one on which most essentially depend the general comfort and sufficiency of our existing generation of labourers. We have already demonstrated, that the limit of cultivation is pushed forward by every invention which makes the labour of workmen, either in the agricultural

or secondary classes, more effective than before. If, in virtue of certain machinery, all that enters into the maintenance of an ordinary labourer can be prepared by fewer hands than formerly; this opens the way to a descent among poorer soils than formerly: and the more perfect such machinery is, the greater is the length to which agriculture is extended. Now, to that extreme limit the population have multiplied; and from that limit must the agriculture again recede, if such machinery shall be forcibly put down. It will affect the general supply of the population with food, just as a permanent visitation of blight or barrenness would; so that the vindication of machinery stands on much higher ground than merely its subservience to the enjoyments of the wealthy. It will re-act most calamitously on the very classes who are most outrageous in this cause—it will stint the supply of first necessaries,—if, in terror or subjection to the tyranny of the multitude, either our farming or manufacturing capitalists shall be forced to discontinue their machines and implements of labour.*

And the reflection here occurs, that in proportion to the high and artificial state of improvement which any country has reached, will the distress be; should law, and security, and social order, in that country, from whatever cause, whether by invasion

* The thrashing machine, beside helping down the agriculture to inferior soils, has a still more direct influence on the supply of food, by the more entire separation which it effects of the grain from the straw.

from without or by anarchy from within, come to be suspended. With every step in the progress of such improvement, has there been an onward step in the cultivation of the soil; till, corresponding to its high-wrought and extreme husbandry, the land has been filled with an extreme population. But without the utmost protection and deference to the rights of property, and confidence in distant returns on the outlays of capital, and safety from that violence which never comes in a shape so formidable to the resources of the nation, as when directed against the apparatus of our farms—such a high style of husbandry cannot possibly be up-holden. The effect will be most tremendous; and far more severe than in a land of coarser husbandry, which in its days of peace has not been elaborated forward to its extreme resources, and so, in its days of warfare or misrule, will not be thrown backward upon that extreme necessity, to which every territory that is at once fully cultivated and fully peopled, would, in these circumstances, be most certainly exposed. This consideration should operate powerfully at present, in the fearful conflict that is now at work between the two elements of liberty and order. Were there to be a season of insurrectionary violence in these islands, we believe, on the principle which we have just stated, that England would suffer more than Ireland; and that, in point of intense and intolerable wretchedness throughout its families, it might then be said, “There has been no such distress in any land, or

such wraith upon any people." Amid the contests of partizanship, the high and great principle should never be lost sight of on either side ; that, in the preservation of justice, and authority, and good government, no country in the world has so mighty a stake as our own ; and that, even by the partial relaxation, but still more by the subversion of these, will the comfort of no other people, and the prosperity of no other land, experience so calamitous an overthrow.

(C. pages 104, 150.)—*On Home-Colonization.*

There are very few countries which do not present large tracts of land, on which the experiment of home-colonization may be tried. The question then is, Why are they at present unoccupied ? There can be no doubt, that in such a country of law, and security, and enterprise as our own, they would have been cultivated, could they, at the existing rate of profit, have remunerated the farmers. This is an object which may, with all safety, be left to the guidance of personal interest, and to the sharp-sighted intelligence of men calculating and scheming for their own individual advantage. It is not the want of capital which accounts for the non-cultivation of land in any country teeming with capital like our own ; but an apprehension, either

on the part of occupiers or of money-lenders, that if capital were embarked on the cultivation, it would not be returned with an adequate profit, and perhaps even be lost partially or altogether. And if individuals would find it a losing speculation, we have no reason to believe that corporations, still less the largest corporation of all, the government, would find it a safe one. We may rest assured, that, down to such land as will barely remunerate the outlay and expenses of its cultivation, the capital in the hands of individuals has not only reached this limit, but is pressing upon it closely, and is even wasting itself on vain attempts to pass beyond it. And so we may safely assume, that in any old country, which has long been in favourable circumstances of peace, and civilization, and order, for the development of its natural resources, if land hitherto uncultivated has been pitched upon for the purpose of home-colonization, it is land of a lower fertility than what can repay the expenses of its own husbandry with a fair profit to the cultivator.

But passing over the element of profit, which forms but an inconsiderable fraction of the whole return, it may be said of the soil which is entered by home-colonization, that it is not able to feed its agricultural labourers with their secondaries; and that, therefore, a full complement of labourers cannot be applied to such land, without a lessening of the disposable population. Not but that, in country parishes, a sufficient, an overflowing number

of agrarian workmen might be had for the enterprise; but, supported as it must be by a tax, the produce of which formerly went to the purchase of luxuries, there of consequence must eventually be so many of the disposable population thrown out of employment. Still, in spite of this circumstance, there would be a relief afforded upon the whole by such a measure, to the general pressure under which the community laboured from the excess of its own numbers. For the disposable labourers thrown out of employment would form but a fraction, and in the first instance it might be a small fraction, of the whole number enlisted in the undertaking. If the land they began with yielded subsistence for nine-tenths of the essential labourers connected with it, then, on the supposition of a hundred men being employed, only ten would need to be transferred from the disposable class to the agricultural or secondary; and the return yielded would form a clear addition, in the food of ninety labourers, to the previous means of subsistence in the land. This number of idlers would be translated, not into what can rightly be termed profitable employment, but into employment, that, with the help of a tax providing for one-tenth of their maintenance, enables them to make out and complete the whole of it. The advantage of such a scheme over that of all other charity-work, is quite obvious. The forcing of a manufacture beyond its natural limit, produces no food; and by edging in, as it were, to a share of the pre-existent food,

so many of the superfluous population, it but condemns the whole population, each to a scantier portion than before. The forcing of agriculture beyond its natural limit, does create a clear addition to the food of the country; and if carried to a great extent, it may for a season, and before the population have had time to overtake it, yield, in the cheapening of the first necessities of life, a sensible relief to the community at large.

This holds forth an inviting outset for the scheme; but it is well to mark its progress, and, if indefinitely carried forward, the final result of it. Once the natural limit is broken, and the *deficient* soils are entered on, the cultivation cannot proceed downwards, but by an increasing tax on the wealthy, and larger and larger drafts on the disposable population. At each successive descent, a temporary relief may be experienced; but with the same recklessness and relaxation of habit on the part of labourers, the pressure of a redundancy in our numbers will ever and anon recur with the same intensity and feeling of straitness as before. We should at length touch on the ultimate and impassable boundary of such a process, when, for the purpose of upholding it, the wealthy had to be taxed till they were reduced to the necessities of life, and the last man of the disposable population to be withdrawn, in order to make out the requisite labour on the last, and therefore most deficient soils which had been entered on. We should then be landed in a more populous nation, yet not have

a single disposable individual within its confines. Each would labour for his own essential maintenance; and all the interest or enjoyment connected with the services of a disposable population, behoved to be abandoned. This is what may be termed the extreme possibility of the system; but it would never be realized. It would surely break up, and that long anterior to such a consummation. Landlords, subject to an indefinite and ever-growing taxation, would at length cease to feel an interest in the administration of their own property. They would not continue to be the receivers of rents, when this was so nearly tantamount to being the mere organs of transmission, through whom the surplus produce of the superior found its way to the deficient soils, and was there absorbed in the expenses of a profitless and ungrateful cultivation. It is fearful to contemplate the issues, after that property had thus been undermined, and the ancient ties had been dissevered which connected the soil with its original possessors. The occupiers of the barren, might then turn in fierceness to the occupiers of the fertile land, on the wonted channel of conveyance, in the person of the landlord, having at length given way. A lax sense, or an imperfect arrangement of property, in a country yet but thinly inhabited, and of unbroken capabilities, is still so prolific of disorder, as to verify the maxim, that a state of nature is a state of war; but this disorder must be thickened and aggravated ten-fold, should the same dissolution take place in

a country of teeming population, and whose very deserts now swarmed with a host of colonized paupers that had overflowed the natural limits of the agriculture. In the scramble that ensues, we shall perhaps have to witness another of those dread calamities which may be awaiting us, and which we fear nothing will avert, but a timely moral and Christian education of the people, along with the gradual abandonment of certain inveterate errors which have been suffered to distemper the social economy of our land.

Such being the natural out-goings of the system of home-colonization, this alternative should be carefully weighed at the commencement of it—Whether it is better that the people should, by a right preventive check on their own number, have room and sufficiency within the natural limit of the agriculture, or should be encouraged to multiply beyond that limit by a scheme, the proposal of which has met with great acceptance from many patriots and philanthropists in our day? It is utterly a vain hope, that we shall ever, by means of such settlements, escape from the pressure of a redundant population; and a momentary slackening of the pressure is the most that we can expect from it. And this descent among the deficient soils to make room for a surplus population, is sure to be accompanied by a descent in the circumstances of the general population. The very circumstance of the soils being deficient, implies the necessity of a charitable intervention, in order

to complete the maintenance of those who are there colonized. But, generally speaking, when the hand of charity is stretched forth, and more especially in behalf of a whole multitude, it is not for the purpose of upholding them in that state of average sufficiency which obtains among labourers, but only for the purpose of saving them from starvation; not to keep them in comfort, but to keep them in existence. These home-colonists, if the system be carried to any sensible extent, will not be on the footing of independent labourers earning a respectable wage, but on the footing rather of paupers, or the dependants of a vestry, who have their supplementary allowances doled out to them, with that niggardly reluctance which usually marks the proceedings of an organized system of relief. Here, then, we have a population encouraged and virtually called into being, who are constrained by their situation to live beneath the par of human comfort and subsistence, and whose very presence in the land will act as an incubus with overhanging pressure on the general condition of our peasantry. They form a body of reserve, from whom masters may indefinitely draw, in every question of wages between themselves and their servants; and by means of whom, therefore, they can, as in a market overstocked with labour, bring down indefinitely its remuneration. We hold then, in addition to every other evil of the system, that, once it is entered on and continues to be extended, the working classes will be sealed thereby to irrecoverable degradation.

It is at its outset, then, that every enlightened philanthropist should take his stand, and at once proclaim, that nothing will serve the exigencies of a land brought to such extremity as this, but a vigorous application of moral causes. We hold it as being of inestimable benefit to all the classes of society, that cultivation should stop with the last land which yields a profit to the farmer, after having fed both its direct and secondary labourers. The momentous question is, Shall we step beyond this limit, or keep within it? By the former, we enter on a headlong process of degradation, through which we obtain, no doubt, a larger, but withal a more wretched peasantry. By the latter, we restrict ourselves to a smaller produce, and a smaller population, keeping the disposable class entire; but leaving it possible, by indefinite moral and literary cultivation, indefinitely to raise the comfort and condition of all the classes. There is a beautiful harmony here, between the interest of the landed proprietors and the interest of the general community. Landlords, on the one hand, would be left in full possession of their rents, and in full command of the disposable population. The general population, on the other, would be retained within the boundaries of a soil, fully able, even at its worst extreme, to maintain the families who laboured it. It is a big alternative; and the most opposite results are suspended on it. Either the population would be restrained within the natural limits of the agriculture, and might be raised by

moral culture into higher and higher states of sufficiency ; in which case the rent of landlords would be kept up, or if encroached on at all, (and we should rejoice in such an encroachment,) it would be by the higher wage of a now improved and independent peasantry. Or this rent would be wrested from them by the necessities of a pauper peasantry ; in which case there would, along with a letting down of the revenue of the landlords, be a letting forth of the population on deficient soils ; and so, a landing both of the higher and lower classes of society in one common degradation.

This process is as good as already entered upon in England. The pauperism of that country may be regarded, in certain of its modifications, as a method of home-colonization in disguise. In as far as the wages are paid out of the poor's rate, in so far may the farmer be induced to bring down his agriculture among soils that cannot repay the natural expenses of their husbandry. Of course, he cannot afford to do this without paying a less rent to the landlord than he could have otherwise afforded ; and indeed, in many districts of England where the redundancy of people has been most severely felt, there has been a partial remission of the rent, for the express purpose of enabling the farmer to take the parochial applicants into employment. The work of his farm may, by this time, have been fully engrossed up to the limit of that agriculture which can remunerate itself. But better it is to have a partial return from the labour

of these supernumeraries, than no return at all. Better keep them in employment, though it should yield but a fraction of their maintenance, than keep them in total idleness. Now this is the virtual commencement of a scheme of home-colonization, and offers indeed a distinct exemplification of its several parts and consequences. The people who are thus admitted to country labour, can only find occupancy among those extremes of cultivation, where the additional produce is unable to maintain the additional men who have forced themselves into service. They cannot raise enough for their own support, to complete which, rents are encroached upon ; or, in other words, an agrarian population is multiplied and upheld at the expense of the fund for the support of the disposable population. From this quarter then, from towns where employment will languish, may we expect an additional invasion on the already overpeopled land ; and therefore upon that part of it which lies beyond the natural limit of cultivation. It is fearful to contemplate the result, if the present system of England shall be longer persevered in. There is nothing more likely to bring on a crisis, than this unnatural accumulation of people ; and nothing more certain to aggravate its miseries and horrors, when it shall come to be realized. If, during a period of turbulence and disorder, the agriculture shall be at all relaxed, (and what more likely, from the loosened and lessened interest of the administrators of landed property, in estates that become

every year less valuable and more vexatious to them?) or if, during the same period, the now artificial economy of parish management shall be suspended, so that either the produce shall be diminished, or the existing distribution of it shall be deranged—we cannot imagine a more fearful perspective than the famine, and the mutual ferocity, and all the evils of anarchy, which will then be let loose upon our suffering families. There are clearly elements at work towards such a consummation; and far more imperative therefore, than the necessity for a reform in the politics, is the urgent necessity for a reform in the economics of England. The one opens a much higher walk than the other, for the wisdom and benevolence of true patriotism. In younger countries there may, by an enlargement of means to the population, be a comparative ease and tranquillity for centuries to come. In a country, brought as ours near to the uttermost verge of its resources, the only effectual and lasting remedy is, to check the advances of the population upon the means. And nothing, we repeat, is competent to such an effect, but a gradual abolition of the poor's laws, along with the instant and vigorous application of moral causes. Village schools, and well-served churches, and zealous parish ministrations, and a universal system of popular education, into which the lessons of the gospel of Jesus Christ largely and pervadingly enter,—these form the main elements or means of our nation's peace, and our nation's greatness.

(D. page 130.)—*On the National Debt.*

There is one conclusion from the argument in the text, which appears to us inevitable; and which, paradoxical as it may appear, we hold to be amply borne out both by reason and experience.* We can perceive no flaw in the deduction, should it only be granted that the capital displaced from business by loans is repaired, not by the parsimony of capitalists, but by the privation of customers—an inference that comes direct from the most elementary principles in political economy; and which is abundantly countenanced by the phenomena, both of the high profit that takes place in seasons of borrowing, as indicated by the low price of stocks, and by the obvious resuscitation of the withdrawn capital which must take place every year, as indicated by the unimpaired sufficiency of capital for all mercantile and agricultural concerns.

The views, then, presented in the text, on the subject of capital, have suggested to us the following important practical inference, in regard to the policy of the funding system.

* We subjoined the greater part of this argument some years ago to a former work, entitled, "The Christian and Civic Economy of Large Towns," but the extraordinary nature of the conclusion, and its immense practical importance, if true, as being decisive, we would not only say of the vital impolicy, but of the prodigious infatuation, nay, insanity of the funding system, have led us to insert it in this place.

The sum borrowed by government is withdrawn from commerce and manufactures, and must, to the extent of its power in producing commodities, and bringing them to market, lessen the supply of these commodities.

The price of these commodities rises in consequence, and to such a degree, too, that the sum will be replaced; so that, in the course of a little time, the capital, restored to what it was by the operation of the now higher profit, will be as fully commensurate to the business of the country as before, when profits will again sink to their wonted level.

But, should the same sum be borrowed next year, the same deficiency of capital will occasion another year of deficient supply, and of those consequent higher prices and profits which are the unavoidable result of it. The deficiency will again be filled up as before; and it will not be for the want of a capital to borrow from, that government shall be arrested in this career, however much it may feel itself arrested by the insufficiency of the taxes necessary to defray the interest of the increasing debt.

There might, however, be successive yearly borrowings for a considerable time; and in this way, government has provided itself with means, over and above its annual revenue, for defraying the expense of our lengthened wars. If there be truth in our reasoning on the subject of capital, this will continue to act upon prices and profits just as long

as the practice of borrowing lasts. There will be as great a sum replaced every year, as shall both uphold the capital that is actually vested in business, and, over and above this, shall afford to government a loan, equal to that of the preceding year. But should the loan not be wanted, should the sum that government went to absorb in this way not find its usual investiture, it will seek an investiture in trade. It will, in fact, restore the trading and manufacturing capital to the state in which it would have been, had government not made these yearly abstractions from it; and, with the now larger capital, there will be a fall of prices and profits.

The important deduction to be made from this argument is, that when government defrays any of its expenses by borrowing, it does so by a method which is doubly more burdensome to the country, than when it defrays the expense by taxes raised within the year.

Should government borrow twenty millions for the exigencies of the current year, there are, in that year, twenty millions' worth less of commodities brought to the general market than there would otherwise have been. But there is nothing in this transaction between government and so many of the capitalists of the nation, that can affect either the power or the inclination of buyers to purchase. There is as effective a demand as before, but a diminished supply—the same expenditure on the part of customers, but, on the whole, twenty millions' worth less of enjoyment in return for it.

Had government, instead of borrowing, raised the twenty millions by additional taxes, the community, no doubt, would have had twenty millions less to spend; but they would not have had the high prices to encounter, which are consequent on those abstractions of capital produced by government-loans. It is quite the same thing, whether the community shall go to market with the usual amount of money for purchases, but with prices raised to the extent of twenty millions; or shall go to market with twenty millions less of money, but with the usual prices. In either way, it suffers the loss of twenty millions' worth of enjoyment; or, in other words, it suffers no greater loss by being taxed to the extent of twenty millions, than it does by this sum being borrowed from the money-holders or capitalists of the land.

Under the borrowing system, the public are subjected, through the medium of higher prices, to the expense of repairing deficiencies, occasioned by government-loans, in the capital of the nation. The public could as easily, through the medium of higher taxes, have yielded, direct to government, the whole amount of the sums borrowed. The ability, on the part of the nation, to keep up the capital, in spite of the repeated drafts made upon it by borrowing, indicates the same ability to withstand equal drafts, if made upon it by immediate taxation. The whole sum borrowed for any year, though primarily and ostensibly raised from the money-holders, is in fact raised from the public—

and raised, too, *within the year*. The burden could have been as easily borne, if the whole sum borrowed had been raised within the year by a direct levy. It makes no real difference, whether bereft of a given amount of enjoyment by means of higher prices or higher taxes.

It is thus that the national debt has all been virtually paid once, and yet remains to be paid over again—paid, in the first instance, as it was contracted, by the high prices consequent on a deficient capital; and to be paid, in the second instance, to the actual creditors, either by a liquidation of the principal, or by a perpetual interest.

The hardship on the nation would not have been greater, though all the money borrowed had been raised by taxation, than the hardship actually borne *at the time* when the loans were contracted. And there is not a period of our by-gone history, even though the years of profusest expenditure should be fixed upon, in which we were not just as able to render, in additional taxes, all the sums that were raised by borrowing, as we were able to support the augmented prices consequent upon the loans; and by which, in fact, the whole amount of these loans was drawn from the community, to repair the abstractions which had been made upon the capital.

The difference, then, between the system of raising money by loans, and that of providing for all the expenses by taxation, is that, while in both ways the same pressure is made *at the time* on the

comfort of families, in the former way there is the formation and growth of a great national mortgage, which remains to oppress and enfeeble the country. In either way, the state may obtain exactly the same supplies; but, in the former way, it obtains them at a double expense to the nation. The present burden is just as heavy in the one way as in the other; over and above which, there is a prospective burden equal to the present, which the system of borrowing leaves behind it.

Notwithstanding, however, loans are more popular than taxes, and just because their double mischief is disguised. The people do not feel that government are taking the money out of their pockets by borrowing, though this is virtually done, and at the time too, in the shape of higher prices, if not in the shape of higher taxes. They think that a loan only entails a distant calamity, although the full weight of it is felt in a present calamity. But this is not perceived, and blindness reconciles them to a sore infatuation.

To conclude, then; the whole sum wanted for the service of the year should be raised by taxation, and the expedient of a loan should never be resorted to. Besides the economic argument for this policy, which appears to us irresistible, we hold the very unpopularity of it to be an additional recommendation. It would restrain the public appetite for war. Government would not enter so readily upon any rash or wanton undertaking, if the whole expense of it were not only

actually felt, but consciously felt in taxes palpably imposed for the purpose of defraying it. A more cautious and pacific spirit would thenceforth actuate the councils of the nation.

Mr. Tooke, in his able disquisition upon high and low prices, seems not to have fully adverted to the distinction in point of effect, between a war expenditure that is defrayed wholly by taxes, and a war expenditure that is defrayed partly by loans. He is right in asserting, that the money which is in the hands of capitalists, is as much spent as would be the same money in the hands of government; and that, therefore, when transferred from the one to the other, there is no greater demand thereby created to bear on the general market, and so to raise prices. But it should be considered, that though such a transference gives rise to no greater demand, it gives rise to a less supply; and that this will raise prices just as effectually. The twenty millions borrowed by government from so many of our capitalists, might all have been spent by the latter within the year, in the outlays of their business; and so have told as effectually on general prices, as the same sum spent by government. But the borrowing has caused a cessation of this business, insomuch that there are twenty millions' worth less of commodities brought to market, for the supply of the families of the land.* Meanwhile, their demand for these commodities is the same, and the money which they bring to purchase them is the same; and so the price rises to such a degree, that

'they must be satisfied with twenty millions' worth less of comforts than they would have had, had no such borrowing taken place. It would have been no greater hardship on the community, if, taxed to the extent of the whole loan, they had gone with twenty millions less of money to market, when the prices were not exposed to the influence of the borrowing system in raising them.

That profits are raised by the government loans, seems palpably enough indicated by the effect of these loans on the price of stocks. It is not any apprehension for the security of government, that can account for the whole depression of the funds, at the period of large and frequent loans to meet the exigencies of a war. It arises in great part from the drafts which are made on the capital of the nation, and from the necessary effect which the consequent diminished supply has upon prices and profits. The descent from 90 to 50 in the 3 per cent. consols, during a great part of the French wars, argues a high rate of profit throughout the whole of that period. So long as it lasted, the community were exposed to all the higher prices for the various articles of comfort; and we have no doubt, that, by this difference of price alone, the whole sums borrowed, enormous as they were, actually passed from their hands to replace the deficiencies of the capital. The sum of five hundred millions then added to our national debt, was paid away by the people in higher prices; and better far it would have been, if, instead of this, it had

been paid away by them in higher taxes. It was actually paid, yet still remains an incubus upon the nation.

And the conclusion is not essentially different, although the supplies of government should be raised, in the first instance, by the pure operation of credit, rather than by actual borrowing. Suppose, for example, that a sum so large as twenty millions should be raised within the year, in the shape of exchequer bills. There is, in this case, no abstraction of monied capital from any department of business, and therefore no raising of general prices from this cause. But there is an increase of prices, and to the same extent of twenty millions too, by another cause; that is, if not by a diminution of the money that formerly went to the side of production, at least by an increase of the money that now goes to the side of demand. The truth is, that, by the device in question, no less than an additional twenty millions are brought to bear on an aggregate produce of the same pecuniary cost as before. Through the currency and reception of these bills, a given cost of produce meets with twenty millions more in the market than it otherwise would have done, and average or general prices rise to that amount. Government brings the whole force of this extra competition to raise the price of that which cost but the same as formerly; and the effect of this extravagance on its part, is precisely the same with that of a similar extravagance on the part of landlords, who may

be conceived to spend collectively, in one year, twenty millions more than their income. There is a consequent rise of prices to this amount, which goes to enrich merchants and manufacturers, and to constitute them either the creditors of government, who, in the act of funding their bills, bring a permanent mortgage upon the nation—or the creditors of landed proprietors, whose expenditure in like manner brings a mortgage upon their estates. In either case, the whole effect is a rise of prices; and not a reduction, but a rotation of property.

There is still a third way in which this matter can proceed; and it is worthy of being noticed, because of the important explanation on another subject to which it is subservient. The monied capital vested in the actual business of the country, might be rated, as before, at a hundred millions; and be returned, in ordinary times, by the sum of a hundred and ten millions. If reduced to eighty millions by a government loan, we have already seen, how, in one revolution of the economic cycle, it might be fully restored by the operation of a diminished supply upon prices. But the likelihood is, that the remaining capitalists of eighty millions may not confine their operations to what they can barely do with their own proper capital. They may superadd the power of credit to that of capital, which, in the circumstances supposed, they can do with all the greater safety, because of the large return of a hundred and ten millions to eighty millions that is now awaiting them. Let us ima-

gine, then, that in virtue of being trusted to the extent of ten millions, they can lay out ninety instead of eighty millions on the extension of their business. This would reduce their profits for that year, from thirty to twenty millions; making, therefore, the reparation of the capital a slower process than it might otherwise have been. The sum of ten millions, by which their profits would have been augmented, has passed from them, and taken some other direction, which remains to be inquired into.

It seems obvious enough, then, that as by this device of credit they have brought ninety instead of eighty millions to bear on the outlays of their business, the money price of all which they had to purchase must have risen in this proportion. The chief of these purchases must be raw materials and labour. Confining ourselves to the latter, it may be stated as a general position—That when the operations of trade are extended by credit, the money price of labour rises. In the particular instance before us, it will do so unquestionably. The mere loan of twenty millions to government, will have no effect in this way; for though they are thereby vested with an additional command to that extent over the labour market, which they will of course make use of in adding to their naval and military establishments, yet the power of the capitalists from whom they have borrowed this sum is as much diminished; so that still, after the transaction, the joint demand of the two parties for

the services of men, may be measured by the same sum, as the entire demand of the capitalists before that the borrowing took place. But should these capitalists, by means of credit, bring ninety millions instead of eighty to bear upon the market—then, with the help of the twenty millions now in the hands of government, a hundred and ten millions, in the place of a hundred, will go to the purchase of service and materials together, and so raise in that proportion the money price of both of them. And should government, by such a measure as the issuing of exchequer bills, add to the effect of these doings the operation of a pure credit on their side—there may, between the parties, be a hundred and twenty, or a hundred and thirty millions, instead of a hundred expended within the year, and that chiefly in hiring the services of men. A war, whose expenses were defrayed by taxation within the year, might have no such effect; but the various expedients so much resorted to, of loan and anticipation, have all of them the obvious and certain effect of advancing, for the time, the money price of labour.

Now this advance in the money price of labour, must, we think, tell directly on the money price of all that is purchased by labourers. More especially will it have the effect of raising the money price of grain—that being a first necessary of life. Not that it will necessarily give them a greater command over this prime article of subsistence—for, with only a given quantity of coin in the mar-

ket, a mere advance of nominal wages can have no effect in sharing it out more liberally to the population. Still, however, it will have effect on the nominal or money price of coin. If all the buyers of an article have more to give for it than usual, that more will be given. There may not, in consequence, be the acquisition of a greater share by each; but there will, at least, be an endeavour after it, which is quite enough for raising the money price to all. Mr. Tooke, the able and distinguished author of the "Essay on High and Low Prices," has, we think, succeeded in showing, that the frequent scarcities of that season, go far to account for the high price of coin during the time of the French war. But we have no doubt that the war itself had a share in it. The greater waste and consumption of provisions in the shape of government stores for a navy or army, than by the same number of men in the pacific walks of life, would of itself be an item of no inconsiderable influence—particularly, as a very slight increase of demand tells more powerfully on the price of an article of main necessity, than it does in the case of all other commodities. But the chief effect of war, we apprehend, in raising the money price of agricultural produce, stands connected with the explanation which we have just given—an explanation into which we should not have entered, but for the light which it seems to cast on another interesting phenomenon that we shall now advert to with all brevity.

The question is, How comes it, that during a season of high money prices, there should always a stretch take place in the cultivation of land? This was remarkably exemplified during the last war with France, at which time many a before out-field territory was reclaimed, and, generally speaking, a more thorough cultivation spread itself over the island at large. Now it appears to have all the certainty of an axiom, that no land can be entered on agriculturally, unless the produce yielded in return can feed the agricultural population and their secondaries, beside yielding a profit to the farmer. But we have every reason to believe, that profit was higher throughout that whole season of large borrowings and low prices of stocks, than at ordinary periods; and, in as far as this element is concerned, the cultivation should have been straitened, rather than enlarged; whereas it was the opposite process which took place, and which calls for explanation.

Certain it is, that a higher money price for corn can have no effect on what may be called the natural barrier of cultivation. It cannot make the land that is beyond, more fertile or less difficult to labour than before. It cannot impart to it the capacity of feeding more than its own agricultural workmen and their secondaries, if it wanted this capacity in times past; and, if it remain short of this, it is short of the possibility of being cultivated with a profit. Under all conceivable changes in the value of our denominations and our coins, there

is still the stubborn necessity for the direct and indirect labourers on any given territory, being, at the very least, fed from the produce of it. One can imagine a fall of substantial wages, in which case the men would either be worse fed, or be willing to put up with fewer of the second necessities than before. This would admit a stretch in the cultivation. But it is doubtful whether, on the whole, labourers were worse off during the war than in ordinary times. With the higher prices, there were also higher money wages; and it was, in fact, a rise in the money price of labour which, partly at least, effected a rise in the money price of food. So that, with both the higher profits and the higher wages of that period—which, of themselves, ought to have contracted the agriculture, it is extraordinary, and requires explanation, that still the agriculture should have been extended.

We do not see how a high money price of corn should extend cultivation, if all the expenses of the husbandry, as estimated in money, rose in the same proportion. If the profit of agriculture kept as high, and, still more, if it rose higher than usual; and if the direct and indirect labourers obtained the same share of the produce as food to themselves—then, but for one circumstance, there does not appear the possibility of cultivation being extended, merely because money prices have risen. That one circumstance, which applies more to Britain than any other country, is taxation—and a taxation affecting, in a material degree, the expense of agri-

cultural operations. The truth is, that, in virtue of such taxation, the last land has more to do than merely to feed the direct and secondary labourers, beside yielding a profit to the farmer. Over and above these, the produce which is drawn from it goes to feed an additional population in the employ and service of government. It is taxation, as at present conducted, which forces this destination upon it. There are still taxes on many of the second necessities of life; and taxes which make the implements and whole apparatus of farm labour more expensive than otherwise. But a high money price of corn does not add to the pecuniary amount of these taxes; and this alone will suffice to account for the additional scope and outlet which that price allows to husbandry. For the sake of illustration, let us conceive, that, when grain is at the average price, a hundred pounds' worth, raised from the last land, is divided in this proportion—that sixty pounds defray the natural expenses of the husbandry, and thirty pounds more the taxes; leaving a profit of ten pounds to the farmer. Then let the money price rise from a hundred to a hundred and fifty pounds, and even though the natural expenses should rise in the same proportion, yet, with the taxes, as estimated in money, being stationary, there would ample encouragement be afforded for the extension of the culture among the inferior soils. For, on the supposition now made, the natural expenses would rise to ninety pounds, which, with the taxes still at thirty, would leave no less

than a profit of thirty pounds—or a three times greater profit to the farmer than usual. But he could afford to cultivate at a profit much inferior to this; and therefore can afford, and will feel encouraged, to enter on the cultivation of inferior soils.

And we may now see how it is, that, in the time of war, in as far as its expenses are defrayed, not by taxes, but by loans, there should often be such a general hey-day feeling of prosperity throughout the land. The truth is, that a mere increase in his money receipts, will give one a certain sense of prosperity, or of getting on in the world—though, in virtue of a proportional rise in money prices, he may have no greater command than before over the enjoyments of life. A general rise in money rents and wages, and withal, in profits, will beget the fancy, and even the sensation of prosperity, among the three great classes of society—the feverish exhilaration of high health, without the sound or entire possession of it. Meanwhile, and contemporaneously with this great nominal and apparent increase in the means of the general community, there must, in counterpart to the higher prices and profits of such a season, fall a real weight of suffering, without disguise and without palliation, somewhere. And it is by the mere money annuitants of all classes, that the pressure is chiefly felt—who draw their stated income, and, with the same nominal revenue as before, have to encounter that excess of prices which we ascribe to the opera-

tion of the funding system; and by which we hold that its immense levies are drawn, even at the time, or within the year, in the shape of higher prices, from the pockets of the population—as well as laid, in the shape of a permanent mortgage, on the country.

If our reasoning be valid on the effects that take place during the contraction of the national debt, it will further serve to establish the converse effects that would take place during its repayment. By the one process, capital was turned into expenditure; and there instantly ensued high profits and prices to repair the deficiency. By the other process, expenditure would be turned into capital; and there would as instantly ensue low profits, or rather prices beneath prime cost, and consequent losing speculations to absorb the superfluity. If, when twenty millions were borrowed, the public had to pay these twenty millions in higher prices; then, should these twenty millions be repaid by a tax, that tax would be again paid back to the public in lower prices. Should government establish a property tax, and apply its produce wholly to the liquidation of the national debt, it would bear far more lightly on the community than they are at all aware of. To them it might bear the semblance, but not the reality of distress. The great distress would be among merchants and manufacturers, from the glut of capital. As by the one process, a monied interest was formed, tantamount to the whole value of the national debt; so, by the oppo-

site process, the whole of this immense interest would be swept away. It would afford the most impressive exemplification possible to all our views on the subject of capital. Losses and bankruptcies innumerable, would follow in the train of this great regurgitation. The newly-created capital would seek every where, but in vain, for a profitable investiture. It would force its way into Ireland and more distant places ; and might be the means of a temporary relief from the pressure of our excessive population, both by its reflux on our agriculture at home, and by the impulse it would give to schemes and undertakings of emigration abroad. Our landlords, the ultimate payers of taxes, are not aware of the easy terms on which they might get quit of the mortgage which oppresses them. It comes upon them as a burden at the first, after they had already borne it in high prices. They might cast off the burden at their pleasure ; and that, not by a dishonest cancelment of the debt, but by the literal, honest, and full repayment of it. The heavy taxation, while it lasted, would be compensated by the low prices ; and permanent relief from the interest of the national debt would be obtained, without the expense of a sacrifice.

There is only one qualification that we can think of, in any way affecting these conclusions on the subject of the national debt. In as far as the money is lent by foreigners, there is no abstraction of capital from the business of the country, and no consequent raising of prices. In as far as it is repaid

to foreigners, there is no addition made to the capital within the country, and no consequent lowering of prices. And the same may be said of all those repayments which, instead of being vested either in the home or in the return foreign trade, are carried forth of the land on any enterprise of colonization. Bating these, there would be a mighty lowering in the price of all those articles, on the production of which there was so much more of capital, and in the purchase of which there was so much less of expenditure than before—such a lowering, in fact, as would very nearly, if not fully, compensate for the extraordinary taxation, by means of which the liquidation of the debt is effected.

(E. page 175.)—*On Profit.*

In a recent theory of profit, the native and immediate forces by which it is determined have been lost sight of, so as to carry a mysticism into the science, in all those places of it where profit enters as an element into its reasonings.

On this subject, Dr. Smith's principle is the right one, and should have been adhered to. All other circumstances remaining the same, profit is lowered by the increase of capital, and raised by the diminution of it. It is equal to the difference between the cost and the price of commodities; between the

sum laid out by one party on the production, and the sum laid out by another party in the purchase of them; between the amount of capital employed, and the amount of its returns. Let the latter be stationary, and it is quite evident that profit will vary with the former, but in an inverse order—the profit being large when the capital is small, and small when the capital is large; or even being extinguished, nay, converted into loss, which is a possible and frequently realized thing, when the capital is so large as either to equal or to exceed the returns which it meets with.

It had been well that both the language and reasoning of Dr. Smith had been retained upon this subject. The proper and immediate cause of a fall in profits, while the effective demand for commodities remains unaltered, is an increase of capital without a corresponding increase in the returns that are made for it. It is determined by the state of competition between capitalists, or rather between the capitals which they hold. If these increase either in number or in magnitude, without a proportional increase in the returning power, by the opening up of new lands, and the consequent increase of population; then profits must decline with the progress of accumulated wealth in society.

Consequent on this accumulation of capital, and antecedent to this fall of profit, there must have been an extension of the business of the country, in all the various branches of its trade and manufactures. And this extension will take place in

the business of agriculture, as well as in any other. The same circumstances which lead men to extend their transactions in commerce, though with the prospect of a less return than before, will lead them to extend their transactions in agriculture, with the prospect of a less return than before. In other words, land of inferior fertility and produce will, by the operation of this cause, be taken into cultivation. This concern, like every other, will fluctuate with the fluctuations of profit and interest in society. Should there be a fall of interest, and a consequent facility of borrowing, in any particular year, or period of years, farmers will be induced to attempt soils that had not been previously entered. So soon as men are satisfied with a less return, they will carry the plough to a poorer territory than before. This is one of the many phenomena that must ensue from an augmented capital, and a reduced rate of profit; and not peculiar to the affairs of husbandry, but exemplified in every other walk of enterprise and speculation.

Yet this phenomenon, but the subordinate result of a law, having a distinct principle of its own, has itself been magnified into the principle; and a controlling force has been ascribed to that which is only the determinate consequence of a prior force, determining the rate of profit. The effect has been mistaken for the efficient. The produce of the land that is said to yield no rent, is conceived of as representing the aggregate of wages and profit. At most it is but the measure, and not the deter-

minator, of the sum of these two. The wages of labour are not low, nor is profit either, because land of an extremely poor quality has been taken into cultivation; but this land has been taken into cultivation, because wages and profit are low. If wages be low, it is because labour, or the number of labourers, is in excess. If profit be low, it is because capital is in excess. But competition, the moving force in both instances, has been well nigh lost sight of. The land last cultivated has furnished some of our later economists with the materials of a formula—where the three elements of rent, and profit, and wages, have been made to enter, as symbols do into an equation, by means of a few transpositions upon which, the whole doctrine and philosophy of the subject has been newly cast, and are held to have been infallibly expounded.

And it is curious to observe the proceeds of this new mode of reasoning, through which, by a certain dexterous algebraic play, results are elicited the most unexpected, and certainly the most opposite to all experience. One specimen may suffice. When once the produce of the last cultivated land enters as a sort of fixed quantity into an argument; then, representing, as it does, the sum of wages and profit, it will follow of course, that when wages rise, it can only be at the expense of profit, and when profit rises, it can only be at the expense of wages—the one being high when the other is low, and conversely. The strange conclusion deduced from this is, that by increasing the wages of labour,

we are on the high road to the underselling of our neighbours in foreign markets; because that the dearer the labour expended on the preparation of export articles, the cheaper can it be afforded when presented for sale. And the reason of this is, that profit being just as much lower as wages are higher, we make a saving on the cost of the article, with every new transfer in the course of its sales or stages of preparation, till the ultimate price may, in fact, be very much reduced by the repetition of this effect at each of the successive centages. And hence the paradox in question, advanced too with a sort of axiomatic certainty. It is a striking example of the extravagance into which men are sure to fall, when, forsaking the obvious and real principles of a subject, they give the precedence, over all sense and all experience, to the categories of a school.

We shall be saved from all such devious conclusions, if we only keep in sight the proper and immediate causes by which both wages and profit are determined. There is a greater identity of principle between them than is commonly adverted to. The one depends on the proportion which the quantity of labour bears to the effective demand for its products; and the other, also, on the proportion which the quantity of capital bears to the effective demand for its products. Or, just recurring to the old language and style of conception upon this subject, we should say, that the one varies with the intensity of the competition among

labourers for employment, and that the other varies with the intensity of the competition among capitalists for business. Should there then be a high standard of enjoyment among labourers, they will not marry so as to overstock the country with population; and so, just because their taste is high, their wages would be high: thus landing us in the important and delightful conclusion, that the people, collectively speaking, have their circumstances in their own hands—it being at the bidding of their collective will, whether the remuneration for their work shall be a scanty or a sufficient one. The same principle has not been extended to profit, though it be as strictly applicable to the one element as to the other. It is for each capitalist to determine how much of his profits he shall expend on personal or family indulgences, or how much of them he shall reserve for additional outlays upon his business. Should there be a general and voluntary descent among capitalists in respect of expenditure, this of itself, by adding to the investments in trade, would produce a general fall of profit. Whereas, by means of expenditure in this class of society, profits might be sustained at any given level—a level as much determined by the standard of enjoyment, or collective will of capitalists, as wages are by the collective will of labourers. However simple and obvious this consideration may be, yet the most important, and as yet unnoticed conclusions are deducible therefrom. Our only inference at present is, that there is no

headlong necessity in any state of society, for either a wretchedly low wages or a ruinously low profit. Both, in fact, are dependent on moral causes. There is a moral preventive check, which, if put in steady operation throughout the labouring classes, would keep wages high. And, however little adverted to,* there is an analogous check, which, operating among capitalists, would keep profit high. Instead of wages being necessarily low when profits are high, or conversely; both may rise contemporaneously, or fall contemporaneously. In other words, there is still a highway open to us, both for a well-conditioned peasantry, and a prosperous order of merchants and master-manufacturers in the land. There is no irreversible fatality in that march of agriculture among the poorer soils, which has been represented as bearing down profit and wages. Instead of this, profit and wages may each, in any point of the progress, make their own resolute stand, and arrest the march of agriculture. Let labourers, on the one hand, make a stand for higher wages, (and this they can only do effectively, by refraining from over-population;) and let capitalists, on the other, make a stand for higher profit, (and this they can only do effectively, by refraining from over-speculation :) and then, so far from their condition being overruled by the state of the husbandry, they may jointly overrule that state;

* It is but justice to state, that this principle has been distinctly adverted to, and ingeniously illustrated, by Mr. Thos. Perronet Thomson.

and, just by the position which they might voluntarily unite in keeping up, may they both lower the rent of land, and somewhat limit its cultivation. Instead of being borne down by the tide, they could withstand and stem it; and instead of lying prostrate before the absorbing rent of the landlords, they might prescribe their own bounds to the wealth of the proprietors of the soil, which it could not overpass.

This is the only effectual, but withal peaceful and legitimate way, in which the other two classes of society can make head against the landlords. Rent, profit, and wages, have been denominated the three ingredients of value. We confess, that though at the expense of, and by an encroachment on the first, we should like the two last admitted to a larger relative share than they have at present; or, in other words, that the standard of enjoyment both among capitalists and labourers were higher, though, as a necessary consequence, the proprietors of the soil behoved to live less luxuriously, or less splendidly than before. This consummation is not to be arrived at through the medium of a contentious politics, or by the triumph of what has been called popular rights. It will be altogether a moral victory, which can only be gained and perpetuated by dint of popular intelligence and worth. Let workmen, having a proper control over their appetite for present enjoyment, abate of their reckless improvidence; and capitalists, having a proper control over their appetite for gain, abate

of their reckless and excessive speculation; and we should soon witness both a higher wage and a higher profit. Instead of the action and reaction being only between these two elements, so that when the one rises, the other must necessarily fall; the action and reaction are shared among three elements, even profit, wages, and rent—so that the two first may draw indefinitely upon the last; and, with the fall of rent, profit and wages may rise, and that contemporaneously. We are aware, that, on this taking place, there might be a contraction of the agriculture; the lowest land having to yield a larger produce for the now increased remuneration of the farmer and labourers than before. But our decided preference is for a happier and more prosperous, even though it should be a somewhat more limited society.

(F. page 196.)—*On Free Trade.*

There is an artificial limit to the extension of trade, created by monopoly; and it is a very general conception, that, after its abolition, all let or limitation is thenceforth done away. But there is also a natural limit, which is felt, when the power to produce on the one hand, is put forth to a greater extent than can be met by the power to purchase on the other. There is palpable intimation given of

this, in those glutted markets, which are the result of over-trading. Even Dr. Smith does not seem to be sufficiently aware, how closely placed the natural barrier is to the artificial one, though somewhat exterior to it. He was too intent on the destruction of the one, to have adverted much either to the existence or nearness of the other. And, accordingly, the idea most commonly suggested by the perusal of his work is, that if the wall of monopoly were only taken down, there would, thenceforth, be room for an advancement altogether indefinite, in prosperity and opulence. Hence the brilliant but unfulfilled anticipations of Canning, and Robinson, and Huskisson, on the opening up of new markets, and the removal of old fetters from the enterprise of British merchants. Hence, too, the mania communicated, as if by infection, from their speeches, and which spread itself, in a spirit of wild and ruinous adventure, over the land. The secret of that deep and general delusion which exists in the minds of men, as if the capabilities of foreign trade were perfectly inexhaustible, was fully let out, when, on the artificial check of monopoly or legal prohibition being done away, they, with an utter disregard to so much as the existence of a natural check, launched forth into all the varieties of unbridled speculation. The consequence was inevitable. On the taking down of the interior wall, they entered as if now on an indefinite career; but soon ran their heads against the exterior wall, which was situated at but a very small

distance on the other side of the first. The consequent check and revulsion were felt throughout the whole commercial world. There may have ultimately taken place, a slight, but scarcely a sensible enlargement. Certain it is, that the sanguine hope of this enlargement was soon followed up, by a disappointed feeling of straitness and difficulty. And the gluts which took place, both on the abolition of the East India monopoly, and on the more general adoption of the liberal system, give palpable evidence, how closely, though somewhat on the outside of the artificial barrier, commerce is beset with a natural barrier, beyond which she cannot overpass.

We are not, therefore, of the number of those who rate very high the economic advantages of the system of free trade. It will not much, if at all, enlarge that wealth which is in the hand of merchants, though, by its means, we may perhaps obtain a greater abundance of foreign commodities at the same cost, or obtain them cheaper than before. There will thus be a certain, though, we apprehend, a small addition to the enjoyment of consumers—which, in spite of the constant preference given by mercantile economists to the means over the end, to the benefit of producers over the benefit of customers, is really, after all, the great and only end of commerce. We can even imagine a slight extension given by means of free trade, to agriculture—in as far as we may possibly, through it, obtain at a cheaper rate, either some of the ma-

tenials of husbandry, or some of those articles which enter into the maintenance of husbandmen. Yet notwithstanding this our humble estimate of the advantages of free trade, in an economical point of view, there are certain attendant moral benefits, if we may so term them, which render the adoption of the system one of the best and wisest achievements of an enlightened national policy. In the first place, it cancels a thousand heart-burnings at home. The admission of one class to a particular trade, with the exclusion of all others, is felt by the community at large to be an injustice and a wrong; and it is well when this, and every other rankling topic of disaffection, are, as much as possible, done away. Government incurs a prodigious waste of popularity, whenever its policy stands associated, in the public imagination, with the failures and fluctuations of trade. And were it for nothing else than to free itself from the burden of this unnecessary odium, it were far better that it stood palpably dissevered from the affairs of commerce altogether; or at least that it never interfered with them, save for the purposes of a revenue, and for the maintenance of the interests of justice. But the system is not more favourable to domestic than to foreign tranquillity. The government which upholds it, not only stands forth in a fair and conciliatory aspect to its own subjects, but also to other nations. The abolition of the restrictive system in commerce, is, in fact, the abolition of the sorest exasperations and jealousies which have taken place

among the states of the civilized world. There is, therefore, a very high philanthropic interest involved in the maintenance of the opposite system. It is on the side both of internal and external peace. It would quiet many a discontent within our own territory, and dry up the teeming fountain of most of our modern wars.

Yet we are not without our fears, that the system of free trade may retrograde, instead of advancing towards its secure and lasting establishment, throughout the coming periods of our history. A liberal politics forms no guarantee, but, we doubt, the opposite, for a liberal political economy.* This

* On this subject I am happy to find that I can appeal to the high authority of Mr. Senior, whose lucubrations on political economy entitle him to a distinguished place among the original and enlightened thinkers of our day.

I refer to the following extracts from his work on "The Mercantile Theory of Wealth."—

"If the unhappy prejudices that now exist on this subject should continue, and if the extension of representative governments should increase the power of public opinion over the policy of nations, I fear that commerce may not long be enabled to retain even that degree of freedom that she now enjoys."—"I have perfect reliance on the knowledge and good intentions of our present ministers—but very little on the knowledge possessed by the country at large. And if ministers are unsupported by the country at large—if each class, in turn, is to be permitted a complete or a partial monopoly, and, bribed by this sacrifice of the general and permanent interest of the public to its own partial and immediate advantage, to allow others to clamour for the power to exercise a similar oppression—if ministers are not aided by the public voice in their struggles against individual rapacity,—we shall tread

is a subject on which the popular and the philosophical mind are not at all in harmony ; and the very admission into parliament of so large an influence from the will of the humbler classes, may, after all, endanger the cause of sound legislation, on every topic where the seeming and the substantial interests of the community are at variance. We are not afraid of any monopoly in favour of the few, to the exclusion, from certain trades, of the many in our own land ; as the will of the many, when rendered effectual in consequence of a freer and fuller representation, will completely overbear any partiality of this sort. But we do fear, that prejudice and partiality may again have the ascendant in the regulation of our commercial policy with the people

backwards, and with greater rapidity, the few steps which we have so laboriously gained. Slowly and reluctantly, and as if parting from our dearest friend, we have begun to withdraw from the restrictive system. If once we begin to re-approach it, I am justified by all experience in the fear, that, in our retrograde motion, we shall not stop at the point at which we originally set out. It will have been an unsuccessful rebellion against popular prejudice, and, like all unsuccessful rebellions, strengthen and consolidate the ruling power."

"In a representative government, where each individual may proclaim, in their utmost exaggeration, his sufferings and his fears, where the power arbitrarily to do good is chained by the same fetters which restrain the power arbitrarily to do evil—where, in short, public opinion is omnipotent, and is, on these subjects, so ill-informed, and therefore so easily misdirected,—there appears, at first sight, no limit to the extent to which individual interest, popular prejudice, and national jealousy, might not carry the system of exclusion."

of other lands ; and that, in an assembly of mercantile legislators, there may, by mutual connivance, be a protection awarded to each of the separate trading interests, however paltry or local it may be, against the rivalry of foreigners. We can even imagine, that, in virtue of a more democratic government, there might be a more headlong propensity to war ; and certain it is, that the popular mind, more especially when inflamed by the cupidity and sensitive alarm of the trading classes, is not always on the side of a pacific policy. It seems all the more imperative in these circumstances, that, with every stretch of the elective franchise, there should be a corresponding stretch of education, and of larger intelligence among the people ; lest, in the scramble of personal or provincial interests, that calm and comprehensive wisdom should be lost sight of, which ought to characterize the legislation of every great empire.

(G. page 237.)—*On Corn Laws.*

For the sake of its moral benefit, we know of no achievement more urgently desirable than that of a free corn trade. There is not a more fertile topic of clamour and burning discontent all over the land ; and, were it but effectually set at rest,

we are aware of nothing which might serve more to sweeten the breath of British society. The interest of cheaper food, is not the only one concerned in the abolition of all those restraints which have been laid upon its importation. There is, beside this, a special interest felt, by that numerous class who are engaged in the business of export manufactures, or export merchandise. The limit of our imports determines the limit of our exports; so that when the one trade comes to its *ne plus ultra*, the other must also be brought to a dead stand. They mutually limit and determine each other. So that the advantage to our export commerce, from a further enlargement of our imports, opening, as it would, a fuller and freer exportation, and telling most favourably for this great branch of trade upon the foreign exchanges, is really one of the most urgent forces that is now operating on the side of an unrestricted corn trade. We shall therefore attempt a brief exposition of what we hold to be the leading principles, and the likely results of such a measure.

First, then, though there should, on the event of an instant and total abolition of the corn laws, be such a reduction of price, as would translate the population into circumstances of larger comfort and sufficiency—we cannot imagine that this would be more than temporary. The proportion of the food to the population might be increased at the commencement; but, reasoning on human nature, and on all experience, this would soon be

followed up by the old proportion of the population to the food. Such a regress of the ocean from our shores, as left behind it a million of rich arable acres, would cause an instant and large descent in the price of grain. But no one thinks that a permanent cheapness would be the result of it. The difference between one census and another, though only at the distance of ten years, may well convince us, how speedily the former balance between demand and supply, and so the former prices of food, would be restored. Yet even still, however frequent and familiar the topic is with economical writers, the great majority of our landholders seem blind to the peculiar and characteristic excellence of that commodity in which their wealth lies. It is a commodity which never can be so multiplied, as permanently to glut the market. By the stimulus which its abundance gives to population, it is very sure, in the long run, to create a commensurate market for itself. Unlike to other commodities, it has the virtue of increasing the demand for itself, just as the supply is increased. This single circumstance should help, and perhaps, above all others, to tranquillize the fears of our landlords, and to give them a feeling of conscious strength and superiority over all the fluctuations to which commerce, in every other of her departments, is liable. They are the holders of the necessaries of life; and, in virtue of being so, theirs is an upper and secure region, where they enjoy, without the possibility of dethronement, an entire and essential

command over the services of men. They misunderstand their own situation, when they participate in the tremulous anxiety of merchants. Their wealth is as indestructible as are the laws and elements of nature; having in it that character of permanency, which belongs to the processes both of the physical and the moral world—based as it is on the capabilities of the soil, and the constitution of humanity.

But let us attempt a closer treatment of the question. We would, in the second place, remark, that there seems nothing in the freest importation of corn, which, *of itself*, should permanently contract the agriculture of our own land. The reason why the poorest of our cultivated soils has been entered on is, that still it had enough of capability for feeding its agricultural labourers and their secondaries, beside yielding a surplus to remunerate the farmer. This reason is not at all affected by the admission of foreign grain from abroad. The capability which had brought down the agriculture so far, would still remain after the abolition of all corn laws. We are aware of a possible cheapening of the article at the first, which, by translating the people into better circumstances, might raise, for a time, the quality both of their food and their secondary accommodations. While this lasted, the poorest soil which cultivation had formerly reached, might not be able to yield the now higher remuneration for labour; and there might, for some very brief season of years, be a receding of the home

agriculture, from the extreme limit to which it had been carried. But without a permanent rise in the popular standard of enjoyment, this could only be temporary. The people would again multiply to the now more abundant food; and this they would just continue to do, till agriculture should recover the very limit from which it had, for a short interval, retired. When the wages, estimated in grain, had become as low as formerly, the agriculture of our own country would then become as large as formerly. Throughout the gradation of soils, the same differences in respect of produce would obtain between the superior land, and that which is said to yield no rent. Or, in other words, the rent of all land, *estimated in produce*, the corn rent of all land, would, in spite of foreign competition, be just what it wont.

But it follows not, that though rent in kind would, after a season of disturbance, settle at the same point which it did formerly, rent in money would therefore do the same. And this, in the peculiar circumstances of Britain, may most severely affect the substantial income of landlords. The thing apprehended is, that, on the opening of our ports for the free admission of corn from abroad, there would be a fall in money prices—and so, a fall in money rents. It would matter not to the real interest of our proprietors, if this fall in money prices extended, and in like proportion, to every other article of enjoyment. There would then, in spite of the declension in nominal income, be the

same real command as before over all the comforts and conveniencies of life. Were labour, and the products of labour, to become as much cheaper as corn had, then the same corn rent would purchase as great an amount as before of all that entered into the use and maintenance of families. But there is a special cause, in our own country, to prevent this. Though every other ingredient in the price of commodities should fall as much as corn, there is an ingredient which remains, and must remain, in a great measure stationary. There can be no proportional remission of taxes to compensate this fall of money prices. There might, had government nothing else to do with a revenue, than meet the outgoings of its present expenditure; for then it might proportionally lessen the allowance of its various functionaries; and, with a money expenditure reduced in all its branches, maintain the public service in as great strength and effectiveness as before. But along with its current and actual expenses, which might fall with the price of all other things, the revenue is also charged with the permanent interest of an old and heavy debt, which no retrenchment can alleviate, save the retrenchment of a partial bankruptcy. This is the capital reason, why, though the money price of grain falls, the money taxes cannot be made to fall proportionally; and it is this, chiefly, which gives to landed proprietors a real and substantive interest in high money rents. The great national mortgage of our public debt has the same effect

generally, that private mortgages have on the holders of individual estates, personally and particularly. They become substantially, as well as nominally richer, by the augmentation of their money income; because then the interest of their debts forms a smaller proportion than before of their whole revenue. And the converse effect takes place on a fall of money income. In other words, it is the existence of our national debt which gives to the possessors of the soil their only rational interest in the corn laws; and the likeliest method by which to harmonize the discordant views and feelings of all parties upon this subject, were an adjustment between the land and the fund holders.

We hold it impossible to effect any right adjustment between these two classes, but by means of taxation—the topic of one of our subsequent arguments; ere we have overtaken which, we can attempt no complete solution of the difficulty in question. But, meanwhile, we can state what appears to us the likelihoods in regard to the future money price of corn, on the event of the abolition of the corn laws. It can be treated, we think, in no other way than as a speculation of likelihoods; the certainties of the subject being, from the very nature of the case, unattainable, but through the medium of experience. Beforehand, we can only offer hypotheticalal results—or the results that would ensue on certain given suppositions, which, anterior to an actual trial, we have really no means of verifying.

We have already stated, that, with every addition to our excrescent population, there behoved to be a fresh and extended draft of corn from abroad; which, by each enlargement of the importation, would become dearer than before. There ensues a very speedy augmentation of difficulty, and so of expense, in the transport of grain, when, in consequence of the need for increased supplies, it must be fetched by inland carriage, even for small distances, from such places as are inaccessible to navigation. With every enlargement of these distances, corn would be landed dearer in our own country; and one can imagine, that, from this cause alone, the dearness, in an unrestricted state of things, may at length be equal to that dearness which is the effect of our present prohibitions. There would, on the event of a total, and, at the same time, instant abolition of our corn laws, be a desultory fall of price, to the utmost consternation of the landed proprietors. But with this abolition of the present restraint on importation, there were the abolition of a present restraint on population also—the excrescent portion of which would, from the commencement of this new era of liberty, grow to a magnitude, that, owing to the number and uncertainty of the elements concerned in the process, is at this moment undefinable. Certain it is, therefore, that there would be a recovery, to a certain extent, from the first cheapness, occasioned by an immediate abolition, if that, instead of the far wiser step of a gradual abolition, were actually resolved

upon. But we hold it beyond the reach of all human anticipation, to say how far this recovery would proceed—or whether it would fully restore the money price of grain, so as to work out a full compensation to our landlords, for the loss of that protection which they at present enjoy.

For who can compute the situation of that point, at which, in a state of perfect liberty, the under-selling power of Britain will be exactly balanced, by the expense of its farthest and heaviest importation? The equipoise would at length be gained; but there are too many influences beyond the reach of precise calculation, for our being able to say when. Every augmentation, on the one hand, of our foreign manufactures, may either lessen their price in foreign markets, or add to the expense of their transit, when their superabundance is forwarded from nearer to more distant places of sale; and every consequent augmentation, on the other hand, of our imported food, enhances the dearness of it: so that the tendency, from the very first, is towards a limit, however impossible to foretell where this limit is to be, or after what increase of our excrescent population it will proceed no farther. We do not know how far, or how long, the industry and ingenuity of our own countrymen are to keep ahead of the industry and ingenuity of the people in other lands. We cannot answer for the number or extent of those regions abroad, where there shall be a constant preference of British goods to their own home manufactures, even though returns must

be made for them in agricultural produce. We cannot tell the degree in which the encouragement of the industry, and the consequent increase of the numbers, of their own people, will absorb their agricultural produce, and make it an article of scarcer and dearer exportation. There is no foreseeing what the new materials, and what the new processes of industry may be, which shall spring up in other parts of the world; so that many of our present customers may be led to seek nearer to their own doors for those articles of taste and of enjoyment, which they now fetch from our far distant island. We cannot anticipate with certainty on either side of this question; neither how far the perpetual additions to British industry and skill shall extend our superiority, nor in how far the rivalry of other nations shall at length deduct from it. There are a thousand possibilities concerned in this matter, through which we can no more see our way, than we can through the contingencies of the weather. They are like the unassignable quantities of an indeterminate equation, which lead but to a dependent or conditional result. We cannot decide beforehand the proportion which, when things are left to their free course, our extrinsic shall bear to our natural population. It lies undisclosed in the womb of futurity; and both the resulting population and the resulting price, that would ensue from a free state of things, must be left to the verification of experience.

Yet, in the face of all this uncertainty, we feel

no hesitation in affirming, both the expediency and the rightness of a free trade in corn. That it would land us in a larger excrescent population than we have at this moment, is little to be doubted. How much larger, we have not the means of calculating. Our own impression is, that it would not be nearly so much larger as is commonly anticipated. We should not be surprised, if, in a free race of improvement among the nations, the excrescent population of Britain did not, eventually and ultimately, amount to one-tenth of its natural. There are certain physical inequalities, which might maintain for us a permanent superiority over other lands, even after all the moral inequalities had subsided. Still we cannot imagine, that, with every advantage we have for commerce, our trade should overlap our agriculture, so far as to extend our population beyond a small fraction of the number maintained by the produce of our own territory. And even though it should be a large, instead of a small fraction, we would still advocate the cause of freedom. The evils apprehended from this are two. There might first be a considerable reduction in the money price of food, to an extent which, if not provided against, would depress the substantial, as well as the nominal income of our landlords. And, second, there might be a precarious dependence on supplies from abroad, which might subject us, at times, to an aggravated suffering, on the event of a general scarcity. Yet we would incur both these hazards, rather than we would the certain

and urgent evil of a dissatisfied population ; who feel, and perhaps with justice too, as if defrauded of their rights, by the compulsory restraints of the legislature on the importation of food. We hold, that an immunity from this sore heart-burning were cheaply purchased, even with the risk of every evil which may have been felt or foretold as the probable consequence of liberty. It were right that it should be a gradual, but, ultimately, a complete emancipation.

It is remarkable, that the first of the apprehended evils, that is, the injury done to the landlords, would become lighter, just as the second, or the dependence of our country on foreign supplies, ever increasing with the increase of our extrinsic population, became more aggravated. It is obvious, that the greater this population became, the heavier would be the expense at which we had to fetch agricultural produce from abroad, so that the money price of corn would rise in this country ; and there is no saying how nearly this might effect a full compensation to the proprietors of the soil. But though it should fall short of this, the real injury to the landlords, by a fall in the money price of corn, stands chiefly connected, as we have already remarked, with the inequality to which it would give rise between them and the fund-holders. And should this inequality be adjusted, the injury would be in a great measure repaired. Now, we can perceive how this might be brought about by a rule of conditional taxation. For the sake of

example, let us imagine that all assessed taxes, and all those taxes on commodities which bore on the general enjoyments of the people, were abandoned; and that there was substituted, in their place, an income tax of 20 per cent. on land and fund holders, to be exacted equally from both classes, when the average price of wheat for the preceding year had been sixty shillings a quarter. A scale of variations in the tax could be made to quadrate with a scale of variations in the price. When wheat fell beneath sixty shillings by successive differences, there might be a series of corresponding diminutions on the income tax of landholders, and of increase on the income tax of fundholders. And the converse of this could be made to take place, when wheat rose above sixty shillings. We should thus, with all the various conceivable changes in the price of wheat, have the land-holders paying 19, or 18, or 17 per cent. and so downward in the scale in cheap years, and in dear, 21, or 22, or 23, and so upward in the scale; while the charges on the fund-holders would stand on the opposite side of par. The same rule of equity might be extended, even to private mortgagees upon land. We enter into no further details or modifications upon this plan. It is offered merely as a suggestion, and as being precisely of that character that is adapted to a measure of which the issues are uncertain. The conditional nature of the scheme meets, and is accommodated to, the uncertainty; and if it serve no other purpose, it may at least demonstrate, that

an adjustment which shall harmonize the main interests of this complicated question, is not impracticable.

The second apprehended evil we hold to be far more serious, than most of the advocates for a free corn trade seem disposed to allow. The dependence of a country, to any great extent, for the subsistence of its population, on other and distant lands, we hold to be a fearful element of insecurity and weakness. It is this which accounts for the ephemeral duration of many of those commercial states, that have figured their brief and brilliant hour in the history of the world. When their commerce abandoned them, the stamina, not of their greatness alone, but often of their very being, abandoned them. *Ol*, if they do abide, theirs, like Venice, has been a shrunk and shrivelled existence ; and that, just in proportion as their now extinct commerce did at one time overlap their agriculture. Our comfort, in reference to Britain, is, that though this may take place to a certain extent, it will not do it far. An excrescence will be formed, but such as may at any time be thrown off without impairing the substantial wealth or greatness of our nation. This accretion to our trade, consequent on the abolition of the monopoly in corn, which so many look to with triumphant anticipation, we should look to with alarm, did we conceive that it would effect a mighty proportional addition to our commerce—and only look to with toleration, because of its believed and hoped-for insignificance. It is

vain to affirm that Britain, when thus extended, would rest as firmly on the motley foundation of home and foreign agriculture, as she would if, within her natural limits, she rested exclusively on her own proper basis. The advocates for freedom reason badly on this subject, when they speak of the dependence between us and other countries being reciprocal—or that they depended as much on our manufactures, as we on their food. The distinction is overlooked here, (and this is a cause of error in many other departments of political economy,) between the necessities and conveniences, or, still more, between the necessities and luxuries of life. They can want our handiwork, but we, with a large surplus population, could not want their food. Our comfort is, that it will not be large. If it were, we should at times be exposed to visitations of fearful calamity—a calamity that might be alleviated, but would not be averted, by the stored and accumulated grain of former years, of which the advocates on the side of liberty conceive that it might ever be in readiness for such an emergency.

Any apprehension we have from a repeal of the corn laws, is for the country at large, and not for the landlords. There might be immediate loss to them, from a change in the power of money; but even this could be made up by an adjusted taxation. After which we see nothing else but their increasing wealth and importance, in every new addition made to the excrescent commerce and population of the land. Their estates would

rise in value, just as the contiguous land of a great city does, with every enlargement in the number of its houses and families. And every season of universal scarcity, while the cause of severest suffering to the British community, would prove a harvest to the British landlords. They would have a fearful command over the services of the disposable population. The high prices of such a period, enhanced by such an accumulation of human beings upon our territory, would mightily enlarge their fortunes, or clear away the debts of their former extravagance. It may be recollected how the famines of 1799 and 1800 redounded to the sudden prosperity of agriculturists. We should anticipate, under the reformed system, a still more frequent recurrence of like fits and intervals of prosperity. The holders of the necessaries of life, therefore, may well give all their apprehensions to the wind. With the certainty that the population will increase just as their commodity increases, from whatever quarter it may be brought, they have nothing ultimately to fear in the consequences of an unexpected freedom. They, at all times, and amid all changes, will be lords of the ascendant. They alone stand on firm vantage-ground, and should of all men be exempted from those mercantile jealousies, by unworthily acting upon which, they have dissevered, both from their persons and their interests, the affections of the people.

But the most important consideration of all, or, at least, that which harmonizes most with the gen-

erial object of our work, is, that however great the immediate relief of a free corn trade may be, it would at best be temporary, and, at the end of some brief period, would at length cease to be the minister of a greater abundance to each of the families of the land, than they at present enjoy. The produce of our home agriculture is mightily increased within the last thirty years. Yet who will affirm that this has secured ought like a permanent sufficiency and comfort to the people? It has given us a larger, but not a more prosperous commonalty than before. And, without a change in the taste and moral habitude of the working classes, this will infallibly be the result of all the additional supplies that we shall ever obtain from foreign agriculture. The increase of their numbers will follow close on the enlargement of their food; so that, at the end of the process, nay, even throughout the process, there will scarcely be the sense and perception of any greater sufficiency than before. By all means let the boon be granted. Let the freedom of this trade be restored perfectly, though progressively—that government may withdraw itself from the obnoxious attitude of appearing to stand in the way of the people's subsistence. Let this semblance of hostility between the governors and the governed be for ever obliterated; for, however insignificant the material, the moral benefit that would ensue is incalculable. The material enlargement from this, as from every other source that we have hitherto attended to, would be but temporary

in its duration, and limited in its amount; and, after it had reached its maximum, we should only behold a larger, but in every way as straitened a population, as we do at present, or as we have done in the past stages of our history. Like all the other external capabilities of our state, it will soon be overtaken. The only sure remedy is an internal one. The people cannot, by any possibility, indefinitely provide from without, for their growing numbers. But by the moral operation of prudence and principle from within, they can accommodate their numbers to their provision. However wide the limit may be, yet, if they inconveniently press upon it, there can be no feeling of largeness. However narrow the limit may be, yet, if they keep sufficiently within it, this of itself, as among the peasants of sterile Norway, will give the feeling of largeness. In a word, this whole argument on foreign trade, and more especially on the foreign trade in corn, but leads to one repetition more of the oft-repeated lesson—that it is not by the force of material resources, but by the force of moral restraints, we shall at length realize the spectacle of a general comfort among thriving and well-conditioned families. In other words, there is no other power than that of Christian education, which can chase away the economic or political distempers of our land; which can either conduct us at the first, or keep us permanently afterwards, in the state of a peaceful, and contented, and flourishing society.

(H. page 289.)—*On the gradual Reform of our Financial System.*

Practical men, with their contempt for theory, which almost always is a contempt for generalized truth, receive with incredulity every affirmation which relates to a state of things that greatly differs from the present state, with whose details and familiarities they are often so minutely conversant. It greatly concerns, therefore, the advocates of every change from one state to another, that the transition which they recommend should be made out in a way as gradual and safely progressive as may be; and that, not merely for the purpose of avoiding those substantial inconveniences, which all sudden and desultory movements are sure to bring along with them, but for the purpose also, if possible, of reconciling those alarmists, whose resistance to innovation forms the great barrier in the way of all improvements.

It is the dictate of true wisdom, that nothing, save where principle or urgent necessity is involved, should be done *per saltum*—but that every thing, when possible, should be done by a process, or without violence to that great law, both of nature and of sound politics, the law of continuity. It follows not, because we recommend a complete change or a complete abolition, that we therefore want the instant change or the instant abolition of

any thing. However firm our conviction of the expediency of certain measures, yet we should desire, in the act of carrying them into accomplishment, never to forget the deference which is due to existing interests, or even to existing prejudices.

On this principle we should deprecate an immediate, although we are friendly to a total abolition of the present corn laws. This should be made to take place by a gradual relaxation in fractional instalments, as of a tenth annually, whereby they might be wholly done away in ten years; at which rate, we feel confident that, before the termination of the process, all parties would be experimentally convinced, how much they had been influenced by the veriest bugbear, in their opposition to a free corn trade.

Yet there is one vestige of these restrictions, which we should feel inclined to retain—not as a relic of the old system certainly, nor yet as a protection to British landlords; but for the sake of a small addition to the public revenue, which it were most rightful and legitimate to raise from this particular source. The truth is, that these importations of grain, although exaggerated by the fancy of many, in respect to their future and eventual magnitude, will land us in a somewhat increased population, and perhaps place us in a somewhat more precarious state than we might otherwise have been. A somewhat larger establishment, both civil and military, may be required by this extension of our numbers; and it is but fair, that the excise-

cent population should, in some way or other, be made to defray the additional expense which their own residence amongst us shall have created. We have already stated our reasons for thinking why taxation should be shifted away from commodities altogether, and more especially from those which are in general use, whether among capitalists or labourers. But we confess, that, for the purpose of reaching the excrescent population, we should not object to a slight duty, as of five shillings a quarter on imported corn—to be remitted only in years of scarcity. So far from this being in contravention to any doctrine of ours, we hold, that not only would it be consonant with strict principle, but that the theoretic perfection of our scheme would rather be completed than impaired by it.

But neither should the general commutation of all taxes into a territorial impost be adopted immediately. It should be done by a series of particular commutations, each of which would lighten the community of some distinct burden, till the whole was, in the course of years, transferred by successive centages on the income of our landed and funded proprietors. The work of reform should begin with those taxes which bear on the essential maintenance of labourers, till every vestige of an imposition on any of their comforts was completely done away. It might then proceed to a similar relief from house, and window, and all assessed taxes. If one-third of these were taken off annually and commuted, we should be wholly delivered

from them in three years. The reform might thus be made to move onward from one commodity, or object of taxation, to another—while, at each step, the administration would gather new popularity, and earn, at every distinct act, a fresh sentiment of gratulation and gratitude from the country at large. Long before the process was consummated, the landlords, however alarmed for the system at the first, would have the experimental conviction of its perfect innocence, nay, of its great positive benefit to themselves. At all events, did their fears turn out to be very obstinate, or even incurable, the process might be arrested at any given point; when, instead of a large income tax to cover all our present duties, they might be saddled with a very moderate one, in lieu of the most obnoxious of our present burdens. It is thus, that without endangering their own prosperity in the least, but, we think, most materially advancing it, they have it in their power, by successive peace-offerings, to mollify the turbulent spirit of the age, and establish their own influence and security on a firm basis for many generations. We know not a more effectual method of charming away a rancorous politics from our nation—or a method by which the discordant elements that are now so busily at work in the midst of British society, could be more readily and fully harmonized.

But it may be long before the doctrine is admitted, that all taxes fall ultimately on land, and still longer, before it is proceeded on in the busi-

ness of legislation. The conviction that it were expedient to commute many of our most irritating taxes into a *general income tax*, may take the precedence, for many years, of the conviction that it were fair and equitable to commute all taxes whatever into a territorial impost. And we should be thankful, if the former conviction were proceeded on till the latter was fully established. It were infinitely better than the present universal system of taxation upon commodities, that there should be an income tax, although it did include the mercantile along with the landed classes. We believe the latter would pay all; but, leaving this question to be settled afterwards between these two classes, there is another question more urgent still, and demanding an immediate settlement; we mean the question between the higher and the humbler classes in society. An income tax on the former, to the ostensible relief of the latter, would wrest their most formidable weapon from the hand of demagogues. It were the grand specific, we believe, for appeasing the outcries of public discontent, and so of warding off from the cause of public order and tranquillity, the principal danger to which, in these perilous times, it is exposed. And it were a cheap purchase of security to the payers, for it would just be making them pay openly, what, though in disguise, they now pay substantially and really.

And we would not only concede, for a time, a part of our theory, to the demand of those who

prefer a general to a territorial income tax : we can even admit, that the main objects of financial reform might be achieved, although the commutation from commodities to income were not universal. There are certain establishments, as the post-office for example, which might be upheld, and continue to yield a revenue to government, though without the penalties and restraints by which it is at present guarded as a monopoly. There are even certain articles of enjoyment, as the higher wines and other undoubted luxuries, which may be taxed to any extent, without affecting the comfort of the lower classes. But sugar and tea enter far too largely into the system of their maintenance to be thus classified ; insomuch, that the abolition of the tax upon these would lead, at no great distance of time, to the cheapening of labour, and so to the extension of agriculture. This tax, therefore, should be wholly commuted ; and, in short, if ought but an income tax is to be retained, it should stand exclusively associated with the enjoyments and expenditure of the wealthy, so as not to leave even the semblance or the shadow of any hardship on the working classes of society.*

With such views, we cannot share in the patriotic enthusiasm which is felt on the subject of re-

* It would more fully accomplish this desirable object, if the income or property tax, instead of being levied by a centage on the whole income, were levied by a centage on the excess of that income over a certain fixed income, beneath which taxation should not be carried.

trenchment. Our patriotism and philanthropy incline us the other way. In common estimation, the demands of the public service are regarded as so many encroachments on the general comfort of society. In our estimation, they are but encroachments on the luxury of one class; and that is, the landed proprietors: and we cannot regard with complacency the abridgments which are made, either in the number or the support of national functionaries, when we believe that the only effect will be, to enlarge the means of the aristocracy, and enable them to live in greater splendour or delicacy than before. So far from taxation having been carried to its extreme limit, we believe it was never at a greater distance from the limit than at this moment; and to substantiate the position, we make our confident appeal to the growing number of those families in the country who are elevated above the condition of labourers, to the increased profusion of their tables, and the increased magnificence of their houses, and furniture, and equipage. In other words, there is still, with all the outcry of our being an overburdened people—there is still a larger fund for the additional imposts of government, than at any former period in British history; or, which is the same thing, a larger disposable population, who, with but the surrender of luxury on the part of private individuals, can be spared for enlarging the civil, and the military, and the educational, and all the useful or respectable establishments of the nation. When told, as

we often are, that no trade can bear to be taxed any further; our reply is, that it is not the trade which furnishes the tax. Trade is but the channel, and not the fountain-head, of all the supplies which come into the treasury. It is not commerce, but its customers, who pay all taxes; and these are, mainly, the holders of the maintenance of labour. They can bear to be further taxed, so long as they indulge in articles of enjoyment which might be dispensed with; and, in giving up these, they might abridge or annihilate many a trade, yet without destroying the sustenance either of its capitalists or labourers, which, instead of being destroyed, is but transferred into the coffers of government. By this process, we but exchange the products of commerce and manufactures for public benefits; and we repeat, that instead of stinting any goodly or desirable objects of patriotism, never was there a time when they might be more freely and bounteously extended. Having such views on the real effects and rationale of taxation, we cannot give our admiration or approval to the scurvy economics of the day. To our eye, they have the characteristics of selfishness and sordidness; and we can see nothing in these paltiy savings of government, but a surrender, of great public interests, that the ignoble gratifications of sense or of vanity may be left unimpaired.

One great benefit of our proposed commutation were, that it would break up the association which now obtains between lofty and high-minded pa-

timotism on the one hand, and this wretched penuriousness on the other. It might perhaps break up too, that low arithmetical politics which has had too long the ascendancy in the councils of the nation. It would bring the real sides of the alternative clearly and undisguisedly into view; making it quite palpable, that the maintenance of the general population was in no way affected by taxes; so that after this element had been discharged from the reasoning, it would become manifest as day, that taxation and the public service might be indefinitely extended, without one earthly interest but that of the landlord's being made to suffer from it.

There is one obvious effect that would ensue from this great change in the financial system of the country. It would lower the money price of manufacturing labour; and so, by cheapening, it would enlarge our exports. The taxes at present do not neutralize; but they so far countervail the natural advantages of British industry, as to bring us sooner than otherwise to the limit of our exportation. By enlarging this limit, and so extending our foreign markets, we should certainly export a greater amount of manufactures than we do at present; and this would seem to land us in what we certainly do not hold to be a desirable object, the increase of our excrescent population. It should be recollected, however, that the same remission of taxes which would cheapen manufacturing, would also cheapen agricultural labour; and so, would

both let forth the agriculture upon inferior soils, and spread a more strenuous cultivation over the whole territory. There would, along then with the extension of our commerce, be an extension of our agriculture; so that the one might possibly not overlap the other to a greater extent than before. The return imports for the additional exports, need not consist of additional agricultural produce, to feed the then larger excrescent population. They may consist of additional foreign luxuries, to be purchased by the landed proprietors, whose then larger revenues, from the extension of the agriculture, should enable them to live more sumptuously than before. Or they may consist of additional second necessities—so named, because, though imported from abroad, they do, in fact, form objects of demand, and so enter into the maintenance of the general population. We have already adverted, and with feelings of gratulation, to the dissimilarity between Britain and those smaller states, whose importance and glory departed when their commerce abandoned them. The difference lies in the amplitude of our agricultural basis, so that although commerce should forsake our shores, we should find a resource and a harbourage for almost all the population who are now employed in it. Now, whatever adds to the agricultural basis, augments this security; and the remission of all taxes which bear on the maintenance of labour, has clearly this effect. It is tantamount to making the country a larger one than

before; and the likelihood is, that with all the facilities given by this financial reform to manufacturing labour, yet, with the commensurate facilities given at the same time to agricultural labour, the excrescent population might not have a greater proportion to the natural, after the change than before it.

SYNOPTICAL VIEW *of the Political Economy of this Volume.**

It has not been our object to deliver a regular system of political economy. It has been to establish the following specific proposition—That no economic enlargements in the wealth and resources of a country, can ensure ought like a permanent comfort or sufficiency to the families of the land. Followed up as these enlargements are, by a commensurate, or generally by an overpassing increase of the population—the country, while becoming richer in the aggregate, may continue to teem with as great, perhaps a greater, amount of individual distress and penury, than in the humbler and ear-

* The foot-note references to books in this article, are to former publications of the Author, wherein some of the principles of the present work have been stated and defended.

her days of her history. In these circumstances, the highway to our secure and stable prosperity is, not so much to enlarge the limit of our external means, as so to restrain the numbers of the population, that they shall not press too hard upon that limit. But the only way of rightly accomplishing this, is through the medium of a higher self-respect, and higher taste for the comforts and decencies of life among the people themselves. It is only a moral and voluntary restraint that should be aimed at, or that can be at all effectual; the fruit, not of any external or authoritative compulsion, but of their own spontaneous and collective will. This is evidently not the achievement of a day, but the slow product of education, working insensibly, yet withal steadily and surely, on the habits and inclinations of the common people; begetting a higher cast of character, and, as the unfailing consequence of this, a higher standard of enjoyment; the effect of which will be, more provident, and hence, both later and fewer marriages. Without this expedient, no possible enlargement of the general wealth can enlarge the individual comfort of families; but, as in China, we shall behold a general want and wretchedness throughout the mass of society. With this expedient, no limitation in the way of further increase to our wealth will depress the condition, though it will restrain the number of our families; but, as in Norway, we shall behold the cheerful spectacle of a thriving, independent, and respectable peasantry.

But though our main object has been to exhibit such proofs and illustrations as may have occurred to us for the establishment of this position; and though we do not profess to have unfolded in our volume, political economy, according to the forms, and in the nomenclature of a science; yet a political economy, such as it is, may be gathered out of it. We may not have accomplished the regular construction of a system, be it right or wrong, but we have at least furnished the materials of one; and we conclude with a brief exposition of its leading principles and peculiarities.

1. The division of the labouring population into the agricultural, the secondary, and the disposable. It presents many new and important relations in the science of political economy. No ground will be cultivated, (unless by the interference of some artificial and compulsory legislation,) that is not at least able to feed the agricultural population employed on it, and their secondaries. Hence the higher the standard of enjoyment is among the people at large, the greater will be the secondary, and the less will be the disposable class; or corresponding to this, the greater will be the wages, and the less will be the rent, while, at the same time, the more limited will be the cultivation, because of the larger produce that will be required from the soil last entered on, to feed the larger number of secondaries.*

2. That the great aim of every enlightened phi-

* "Extent and Stability of National Resources."

lanthropist and patriot, is to raise the standard of enjoyment; even though it should somewhat lessen the rent, and somewhat limit the cultivation. That there must be less food raised in virtue of this narrower cultivation; and hence, a somewhat narrower society. But that this, with general comfort among the families, is vastly preferable to a more numerous society, with all the consequent miseries of an over-peopled land.

3. That there is no other method by which wages can be kept permanently high, than by the operation of the moral preventive check among the working classes of society; and that this can only be secured by elevating their standard of enjoyment, through the means both of common and Christian education.*

4. That however menacing an aspect the policy, whose object is to raise the condition of the working classes, may have on the interest of the landlords, by encroaching on the rent of land—yet they have every security for a great and growing revenue notwithstanding. Such, in the first place, is the strength of the principle of population, that there is no danger but wages will be kept sufficiently low, and cultivation be carried down among the inferior soils sufficiently far. And besides, every improvement in the methods of husbandry, by lessening the agricultural population needed for the work of farms—and every improvement in the powers of manufacturing industry, by lessening the

* “Christian and Civic Economy of Large Towns.”

population needed for preparing the second necessities of life,—will serve to increase the disposable population who are at the service of the landlords, and, along with this, the rent out of which this third class of labourers is maintained. The improvements which are ever taking place in the powers of labour, will greatly more than counter-vail any diminution, effected by the moral check, on the number of labourers. Or, in other words, the standard of enjoyment may rise, and yet the income of landlords rise along with it. Human industry, aided by human skill, is ever becoming more productive; and, from this cause, if workmen will only assert and make good their own proper share of the increased produce, there are abundant means for the comforts both of the proprietors and of the general population being enlarged contemporaneously.*

5. That high wages are not necessarily confined to the period when the wealth of society is in a state of progressive increase; and neither does it follow, that, when this wealth has attained its maximum, and become stationary, the wages of labour must be low. That it remains in the collective power of labourers to sustain their wages at as high a level in the ultimate, as in the progressive stages of the wealth of a country. That the moral preventive check on population can achieve and perpetuate this result; but that nothing else will do it.

* “Christian and Civic Economy of Large Towns.”

6. That in every country, where the laws are efficient and equitable, and the people are industrious, the cultivation of the soil will, under the guidance of personal interest and enterprise, be carried to the extreme limit of its being profitable. That, in these circumstances, to enter on a scheme of home-colonization, is to extend the agriculture beyond this limit; or, in other words, to enter upon soils which will not repay the expenses of their cultivation. That such a process can only be upheld by taxation, or by turning so many of the disposable population either into agrarians or secondaries. That the process reaches its ultimatum, when the last man of the disposable population, withdrawn from the preparation of luxuries, is converted into an agricultural or secondary labourer. That this implies a state of things, when the whole rent of the land is absorbed in the expenses of a pauperism, now accumulated to the uttermost. That by the time when such a consummation is reached, and probably long before it, the landowners, loosened from all interest or care in their estates, would abandon the administration of them. That when once the tie of property was broken, there would ensue an immediate dissolution of society. That the occupiers or labourers on the inferior soils, now deprived of the essential support, which, through the medium of their proprietors, they drew from the superior ones, would turn, in violence, on the more fortunate occupiers of the better land. And finally, that, whatever temporary

respite society might obtain from a scheme of home-colonization, it is a scheme which, if persisted in, must have its final upshot in the most fearful and desolating anarchy.

7. That this contemplation suggests two distinct limits—one, the extreme limit of a profitable, another, the extreme limit of a possible cultivation. That, by abstaining from schemes of pauperism, and, instead of these, giving the whole strength and wisdom of government to the best schemes of popular education, we shall keep within the former limit; and, with an untouched disposable population, whether for the luxury of proprietors, or for the public objects of a sound and enlightened patriotism, we may have, at the same time, the general population in a state of respectable comfort and sufficiency. But if, transgressing the former limit, we enter, with our home-colonists, on unprofitable soils, and so make way towards the latter limit—from that moment, in thus making room for a larger, we are on the sure road to a greatly more wretched society than before; and degrade throughout the condition of the working classes, while we at once impoverish the landlords and enfeeble the state, by trenching on the disposable population.

8. That no trade or manufacture contributes more to the good of society, than the use or enjoyment which is afforded by its own commodities; hence the delusiveness of that importance which has been ascribed to them, as if they bore any creative part in augmenting the public revenue, or

as if, apart from the use of their commodities, they at all contributed to the strength or greatness of the nation; and hence, also, the futility of the common distinction between productive and unproductive labour.*

9. That although commerce re-acted most powerfully on agriculture at the termination of the middle ages, so as to introduce a new habit of expenditure among the landlords, and mightily to extend the cultivation of land—yet, now that the habit is firmly and fully established, we are not to imagine, though any given branch of trade or manufactures should be extinguished, that it will sensibly throw back the agriculture. For that no proprietor would let down the cultivation of his estate, because the failure or fluctuation of particular trades had placed beyond his reach some of his wonted enjoyments. That he would still be at no loss for objects on which to spend his income; and that, therefore, a large income would be as much his earnest aim and his felt interest as before.

10. That there is, therefore, a misplaced and exaggerated alarm connected with the decay or the loss of trade. That the destruction of a manufacture does not involve the destruction of the maintenance now expended on manufacturers; and that the whole mischief incurred by such an event would be to them a change of employment, along with a change of enjoyment to their customers; after which, we should behold, in every country

* “Extent and Stability of National Resources.”

subsisted by its own agricultural produce, as large a population as well maintained as before.*

11. That they are chiefly the holders of the first necessaries of life, or landed proprietors, who impress, by their taste and demand, any direction which seemeth unto them good, on the labours of the disposable population.

12. Grant but industry and protection, and then capital will be found to have in it as great an increasing and restorative power as population has ; and that any policy for fostering, or any fears for the decay of the one, are as chimerical as the same policy or the same fears in reference to the other ; and that capital can no more increase beyond a certain limit than population can.†

13. That the diminution of capital, occasioned by excessive expenditure, whether public or private, is not repaired so much by parsimony, as by the action of a diminished capital on profits ; and that the extravagance of government or of individuals, which raises prices by the amount of that extravagance, produces only a rotation of property, without any further diminution of it, than what arises from the somewhat higher rate of profit, which an increased expenditure brings along with it ; and which higher rate of profit must, to a certain extent, limit the cultivation of land.

14. That trade is hable to gluts, both general and partial ; that no skilful distribution of the ca-

* “ Extent and Stability of National Resources.”

† “ Christian and Civic Economy of Large Towns.”

pital among particular trades, can save the losses which ensue from a general excess of trading ; and that the result is the same, whether the undue extension has taken place by means of credit, or from an excess of capital.

15. That the rate of profit is determined by the collective will of capitalists, just as the rate of wages is by the collective will of labourers—the former, by the command which they have, through their greater or less expenditure, over the amount of capital ; the latter, by the command which they have, through their later or earlier marriages, over the amount of population. That by raising or lowering, therefore, the standard of enjoyment among capitalists, profit is raised or lowered ; that, in this way, both classes may encroach on the rent of land, and share its produce more equally with the landlords.

16. That when the agricultural produce of a country is equal to the subsistence of its population, its foreign trade is as much directed by the taste, and upheld by the ability, of its landed proprietors, as the home-trade is.*

17. That it is not desirable that the commerce of Britain should greatly overlap its agricultural basis ; and that the excrescent population, subsisted on corn from abroad, yield a very insignificant fraction to the public revenue.†

* “ Extent and Stability of National Resources”—and
“ Christian and Civic Economy of Large Towns.”

† Ibid.

18. That, nevertheless, there should be a gradual relaxation of the corn laws, and ultimately a free corn trade—with the exception of a small duty on importation, for the single purpose of a revenue to government, by which to meet the expenses to which it is subjected, from the addition made by the excrescent to the whole population.

19. That the abolition of their monopoly in corn, would not be injurious to the British landlords; saving that the increase thereby given to the value of money, might create an inequality between them and the fund-holders—which inequality, however, could be rectified, by means of an adjusted taxation.

20. That, probably, a free corn trade would not burden the country with a large excrescent population.

21. That Britain has little or nothing to apprehend from the loss of her colonies and commerce; but that a change of employment to the disposable population, and of enjoyment to their maintainers, would form the whole result of it. And that though, historically, foreign trade did, at the termination of the middle ages, stimulate agriculture, yet that now, under all the possible fluctuations of trade, there is perfect security for the cultivation of land, on to that point at which it ceases to yield any surplus produce to the landlord.

22. That, with the exception of their first brief and temporary effect on wages and the profits of circulating capital, and of their more prolonged effect on the profits of fixed capital—all taxes fall

upon land; the interest of its mortgages being included.

23. That this doctrine, though now regarded as one of the exploded errors of the French economists, should not share in the discredit attached to their school—if upheld by other reasonings, and made to rest on other principles, than those of the economists. That the grounds on which our conviction in this matter is established, were never once recognised by these economists—that is, the dependence of wages on an element over which labourers, collectively, have the entire control—we mean population; and the dependence of profit on an element over which traders, collectively, have the entire control—we mean capital.

24. That, to estimate the whole effect of taxes upon land, we should add to the effect of them in aggravating the expenditure of landlords, the effect of them in lessening their receipts. That every tax which bears on the profit or maintenance of the agricultural capitalists, and which bears on the wages or maintenance of the agricultural, and their secondary labourers, and, generally, which enhances the expenses of farm management—creates a deduction, *pro tanto*, from the rent. That, for the commutation of all taxes into a territorial and funded impost, there would be a full equivalent to the landlords—first, in the lessened expenses of their living; and, secondly, in the enlarged rent of all the land now under cultivation. And that they, over and above, would obtain more than an equi-

valent, in the new rent which would accrue from the more extended cultivation of their land, now unburdened of all those taxes by which the cultivation had formerly been limited.

25. That the effect of tithes, in contracting the agriculture of a country, is the same with that of taxes on capitalists, or labourers, or the instruments of husbandry; and that the abolition of both would, in the first instance, enlarge the comforts of the general community; but, at last, would prove exclusively a boon and an enlargement to the landlords.

26. That tithes and taxes ought not to be abolished, but commuted, as there ought to be a more liberal provision for the various branches of the public service; and, more especially, for the support of the literary and ecclesiastical establishments, the endowment of which is indispensable to high scholarship, and to the full Christian instruction of the people.*

27. That the extreme limit of taxation is the landed rental of the kingdom; and that, were taxation carried to this limit, it would place the great bulk of the disposable population in the service of the state.

28. That the capabilities of the nation for defensive war are greatly underrated—they being at least commensurate to the extent of the disposable population.†

* "On the Use and Abuse of Literary and Ecclesiastical Endowments."

† "Extent and Stability of National Resources."

•

29. That the superior influence of Britain over other nations in distant parts, is due to her exports ; and that if, instead of her lighter manufactures, she had to export raw produce, her power in offensive war would be lessened, while she might continue as strong in defensive war as before ; and that, therefore, the balance of power is a topic of needless and misplaced anxiety on the part of British statesmen.

30. That the national debt is tantamount to a general mortgage on the land of the kingdom, and that it has occasioned no diminution of capital—the absorption of capital by the government loan of any particular year, being replaced next year by the operation of the diminished capital upon profits.

31. That if the expenses of a war are raised within the year, they do not enhance general prices ; but that, in as far as they are defrayed by loans, prices rise, and so that the excess upon the whole is equal to the sum borrowed.*

32. That the national debt is therefore a double burden upon the community, having been already paid once in the excess of those higher prices which are consequent upon each loan ; and to be paid a second time, either by a perpetual interest, or by the liquidation of the principal.

33. That the nation is as able to pay the expense of any war by taxes within the year, as by taxes and loans together—seeing that, in point of fact,

* “ Christian and Civic Economy of Large Towns.”

it does pay the loans within the year too, in the higher prices which these loans have occasioned.

34. That the law of primogeniture is essentially linked with the political strength, and other great public interests of the nation.

35. That, on the whole, no enlargement of our economical resources will suffice for the wants of a population, who are under no moral or prudential restraint on the increase of their numbers. That the effect of each successive addition to the means of our subsistence, will, in that case, be only a larger, but not a more comfortable or better-conditioned society. That however numerous, or however successful the expedients may be, for adding to the amount of national wealth—they will be nullified, in point of effect on the sensible comfort of families, by the operation of but one expedient more, which shall ensure a proportional, or beget a tendency towards greater than a proportional, addition to the national population. That a law of compulsory relief for the poor is precisely such an expedient; and that so long as it is in operation, every other device which philanthropy can suggest, or even an enlightened political economy can sanction, will turn out to be futile and abortive.*

36. That but for this disturbing force, which so unsettles the providential habits of the people, and so undermines every principle, whether of nature

* See 'Christian and Civil Economy of Large Towns,' and Pamphlet, on Pauperism, *passim*.

or Christianity, to the spontaneous operation of which the care of the poor ought always to have been confided—society might undergo a very speedy amelioration. Because that a very small excess in the number of labourers, effects a very large and disproportionate reduction in the price of labour; and therefore, by a reverse process, it might only require a very insignificant fraction of relief from the numbers of the people, to operate a very large relief on their circumstances and comforts. That emigration for the lessening of the number, and the various other economical expedients for the enlargement of the means, will be of but slight and temporary effect, so long as the law of pauperism shall maintain the population in a state of perpetual overflow. But that, if these were related to a scheme for the gradual abolition of the pauperism, they would smooth the transition from a system of compulsory, to one of natural and gratuitous relief; after which, it were in the power of common, and more especially of Christian education, indefinitely to raise the habits and tastes, and, along with these, to raise the economical condition of the people.

FINIS.
